

601899, and in cited publications numbered 8742–8743 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcobalamin II; Macrocytic Anemia (TCN2, Accession NM_000355) is another VGAM927 host target gene. TCN2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCN2 BINDING SITE, designated SEQ ID:5916, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35018] Another function of VGAM927 is therefore inhibition of Transcobalamin II; Macrocytic Anemia (TCN2, Accession NM_000355). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCN2. Tec Protein Tyrosine Kinase (TEC, Accession NM_003215) is another VGAM927 host target gene. TEC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEC BINDING SITE, designated SEQ ID:9216, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35019] Another function of VGAM927 is therefore inhibition of Tec Protein Tyrosine Kinase (TEC, Accession NM_003215). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEC. AIG-1 (Accession NM_016108) is another VGAM927 host target gene. AIG-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AIG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AIG-1 BINDING SITE, designated SEQ ID:18190, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35020] Another function of VGAM927 is therefore inhibition of AIG-1 (Accession NM_016108). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AIG-1.

Butyrophilin, Subfamily 2, Member A1 (BTN2A1, Accession NM_078476) is another VGAM927 host target gene.

BTN2A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTN2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A1 BINDING SITE, designated SEQ ID:27804, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35021] Another function of VGAM927 is therefore inhibition of Butyrophilin, Subfamily 2, Member A1 (BTN2A1, Accession NM_078476). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A1. FLJ10120 (Accession NM_018001) is another VGAM927 host target gene. FLJ10120 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10120 BINDING SITE, designated

SEQ ID:19728, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35022] Another function of VGAM927 is therefore inhibition of FLJ10120 (Accession NM_018001). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10120. FLJ10540 (Accession NM_018131) is another VGAM927 host target gene. FLJ10540 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10540 BINDING SITE, designated SEQ ID:19929, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35023] Another function of VGAM927 is therefore inhibition of FLJ10540 (Accession NM_018131). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10540. FLJ23045 (Accession NM_024704) is another VGAM927 host target gene. FLJ23045 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ23045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23045 BINDING SITE, designated SEQ ID:24020, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35024] Another function of VGAM927 is therefore inhibition of FLJ23045 (Accession NM_024704). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23045. KIAA1361 (Accession XM_030845) is another VGAM927 host target gene. KIAA1361 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1361 BINDING SITE, designated SEQ ID:31169, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35025] Another function of VGAM927 is therefore inhibition of

KIAA1361 (Accession XM_030845). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1361. KIAA1750 (Accession XM_043067) is another VGAM927 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:33870, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35026] Another function of VGAM927 is therefore inhibition of KIAA1750 (Accession XM_043067). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. Protein Tyrosine Phosphatase, Receptor Type, U (PTPRU, Accession NM_133177) is another VGAM927 host target gene. PTPRU BINDING SITE1 through PTPRU BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRU, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRU BINDING SITE1 through PTPRU BINDING SITE3, designated SEQ ID:28402, SEQ ID:28407 and SEQ ID:12257 respectively, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35027] Another function of VGAM927 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, U (PTPRU, Accession NM_133177). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRU. LOC144962 (Accession XM_084990) is another VGAM927 host target gene. LOC144962 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144962 BINDING SITE, designated SEQ ID:37792, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35028] Another function of VGAM927 is therefore inhibition of

LOC144962 (Accession XM_084990). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144962. LOC151248 (Accession XM_087143) is another VGAM927 host target gene. LOC151248 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151248 BINDING SITE, designated SEQ ID:39090, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35029] Another function of VGAM927 is therefore inhibition of LOC151248 (Accession XM_087143). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151248. LOC157421 (Accession XM_098756) is another VGAM927 host target gene. LOC157421 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC157421 BINDING SITE, designated SEQ ID:41795, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35030] Another function of VGAM927 is therefore inhibition of LOC157421 (Accession XM_098756). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157421. LOC158014 (Accession XM_088442) is another VGAM927 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:39693, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35031] Another function of VGAM927 is therefore inhibition of LOC158014 (Accession XM_088442). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC220846 (Accession XM_165515) is an-

other VGAM927 host target gene. LOC220846 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220846 BINDING SITE, designated SEQ ID:43663, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35032] Another function of VGAM927 is therefore inhibition of LOC220846 (Accession XM_165515). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220846. LOC220930 (Accession XM_167624) is another VGAM927 host target gene. LOC220930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220930 BINDING SITE, designated SEQ ID:44731, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35033] Another function of VGAM927 is therefore inhibition of LOC220930 (Accession XM_167624). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220930. LOC51320 (Accession NM_016626) is another VGAM927 host target gene. LOC51320 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51320 BINDING SITE, designated SEQ ID:18741, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35034] Another function of VGAM927 is therefore inhibition of LOC51320 (Accession NM_016626). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51320. LOC84549 (Accession NM_032509) is another VGAM927 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC84549, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:26261, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35035] Another function of VGAM927 is therefore inhibition of LOC84549 (Accession NM_032509). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 928 (VGAM928) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35036] VGAM928 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM928 was detected is described hereinabove with reference to Figs. 1–8.

[35037] VGAM928 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM928 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35038] VGAM928 gene encodes a VGAM928 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM928 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM928 precursor RNA is designated SEQ ID:914, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:914 is located at position 67062 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[35039] VGAM928 precursor RNA folds onto itself, forming VGAM928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35040] An enzyme complex designated DICER COMPLEX, `dices` the VGAM928 folded precursor RNA into VGAM928 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM928 RNA is designated SEQ ID:3639, and is provided hereinbelow with reference to the sequence listing part.

[35041] VGAM928 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM928 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM928 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35042] VGAM928 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM928 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM928 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM928 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM928 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35043] The complementary binding of VGAM928 RNA, herein designated VGAM RNA, to host target binding sites on VGAM928 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM928 host target RNA into VGAM928 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[35044] It is appreciated that VGAM928 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM928 host target genes. The mRNA of each one of this plurality of VGAM928 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM928 RNA, herein designated VGAM RNA, and which when bound by VGAM928 RNA causes inhibition of translation of respective one or more VGAM928 host target proteins.

[35045] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM928 gene, herein designated VGAM GENE, on one or more VGAM928 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35046] It is yet further appreciated that a function of VGAM928 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM928 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM928 correlate with, and may be deduced from, the identity of the host target genes which VGAM928 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35047] Nucleotide sequences of the VGAM928 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM928 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM928 are further described hereinbelow with reference to Table 1.

[35048] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM928 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM928 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35049] As mentioned hereinabove with reference to Fig. 1, a function of VGAM928 gene, herein designated VGAM is inhibition of expression of VGAM928 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM928 correlate with, and may be deduced from, the identity of the target genes which VGAM928 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35050] Secreted Frizzled-related Protein 4 (SFRP4, Accession NM_003014) is a VGAM928 host target gene. SFRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP4 BINDING SITE, designated SEQ ID:8938, to the nucleotide sequence of VGAM928 RNA, herein designated

VGAM RNA, also designated SEQ ID:3639.

[35051] A function of VGAM928 is therefore inhibition of Secreted Frizzled-related Protein 4 (SFRP4, Accession NM_003014). Accordingly, utilities of VGAM928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP4. ATP Synthase Mitochondrial F1 Complex Assembly Factor 2 (ATPAF2, Accession XM_058905) is another VGAM928 host target gene. ATPAF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATPAF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATPAF2 BINDING SITE, designated SEQ ID:36790, to the nucleotide sequence of VGAM928 RNA, herein designated VGAM RNA, also designated SEQ ID:3639.

[35052] Another function of VGAM928 is therefore inhibition of ATP Synthase Mitochondrial F1 Complex Assembly Factor 2 (ATPAF2, Accession XM_058905). Accordingly, utilities of VGAM928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATPAF2. Fig. 1 further provides a conceptual description of a

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 929 (VGAM929) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35053] VGAM929 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM929 was detected is described hereinabove with reference to Figs. 1–8.

[35054] VGAM929 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM929 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35055] VGAM929 gene encodes a VGAM929 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM929 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM929 precursor RNA is designated SEQ ID:915, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:915 is

located at position 64221 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[35056] VGAM929 precursor RNA folds onto itself, forming VGAM929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35057] An enzyme complex designated DICER COMPLEX, `dices` the VGAM929 folded precursor RNA into VGAM929 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM929 RNA is designated SEQ ID:3640, and is provided hereinbelow with reference to the sequence listing part.

[35058] VGAM929 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM929 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM929 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[35059] VGAM929 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM929 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM929 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM929 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM929 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[35060] The complementary binding of VGAM929 RNA, herein designated VGAM RNA, to host target binding sites on VGAM929 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM929 host target RNA into VGAM929 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35061] It is appreciated that VGAM929 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM929 host target genes. The mRNA of each one of this plurality of VGAM929 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM929 RNA, herein designated VGAM RNA, and which when bound by VGAM929 RNA causes inhibition of translation of respective one or more VGAM929

host target proteins.

[35062] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM929 gene, herein designated VGAM GENE, on one or more VGAM929 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35063] It is yet further appreciated that a function of VGAM929 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kid-

ney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM929 correlate with, and may be deduced from, the identity of the host target genes which VGAM929 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35064] Nucleotide sequences of the VGAM929 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM929 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM929 are further described hereinbelow with reference to Table 1.

[35065] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM929 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM929 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35066] As mentioned hereinabove with reference to Fig. 1, a function of VGAM929 gene, herein designated VGAM is inhibition of expression of VGAM929 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM929 correlate with, and may be deduced from, the identity of the target genes which VGAM929 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35067] Diphtheria Toxin Receptor (heparin-binding epidermal growth factor-like growth factor) (DTR, Accession NM_001945) is a VGAM929 host target gene. DTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTR BINDING SITE, designated SEQ ID:7661, to the nucleotide sequence of VGAM929 RNA, herein designated VGAM RNA, also designated SEQ ID:3640.

[35068] A function of VGAM929 is therefore inhibition of Diphtheria Toxin Receptor (heparin-binding epidermal growth factor-like growth factor) (DTR, Accession NM_001945), a gene which may be involved in macrophage-mediated cellular proliferation. Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTR. The function of DTR and its association with various diseases and clini-

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM242. Lysozyme (renal amyloidosis) (LYZ, Accession NM_000239) is another VGAM929 host target gene. LYZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LYZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYZ BINDING SITE, designated SEQ ID:5756, to the nucleotide sequence of VGAM929 RNA, herein designated VGAM RNA, also designated SEQ ID:3640.

[35069] Another function of VGAM929 is therefore inhibition of Lysozyme (renal amyloidosis) (LYZ, Accession NM_000239), a gene which a bacteriolytic enzyme. Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYZ. The function of LYZ has been established by previous studies. Lysozyme (EC 3.2.1.17) catalyzes the hydrolysis of certain mucopolysaccharides of bacterial cell walls. Specifically, it catalyzes the hydrolysis of the bacterial cell wall beta(1-4) glycosidic linkages between N-acetylmuramic acid and N-acetylglucosamine. It

is found in spleen, lung, kidney, white blood cells, plasma, saliva, milk and tears. Alexander Fleming (1881–1955), of penicillin fame, discovered and named lysozyme. In a communication to the Royal Society, Fleming (1922) wrote: '..I wish to draw attention to a substance present in the tissues and secretions of the body, which is capable of rapidly dissolving certain bacteria. As this substance has properties akin to those of ferments I have called it a Lysozyme..' Fleming and Allison (1922) demonstrated an unusually high concentration in cartilage, indeed the highest of any tissue. Its role in cartilage is unknown. It resembles lactalbumin (OMIM Ref. No. 149750) in structure. Human lysozyme has a molecular mass of 14,602 Da. Neufeld (1972) suggested that a genetic defect of lysozyme might underlie a skeletal dysplasia. Spitznagel et al. (1972) observed a patient with selective deficiency of a particular type of neutrophil granule which resulted in about 50% reduction in lysozyme levels. The patient showed increased susceptibility to infection. Prieur et al. (1974) described inherited lysozyme deficiency in rabbits. No abnormality of cartilage or bone was noted (Greenwald et al., 1975). Older mutant rabbits showed increased susceptibility to infections, especially subcutaneous ab-

scesses (Prieur, 1975). Camara et al. (1990) identified 2 isozymes of rabbit lysozyme and showed that their distribution was tissue specific. Leukocytic and gastrointestinal isozymes were clearly distinguished, and a possible lymphoepithelial isozyme that resembled the gastrointestinal isozyme electrophoretically and chromatographically but not kinetically was demonstrated. Mutant, lysozyme-deficient rabbits completely lacked a detectable leukocytic isozyme but had gastrointestinal and lymphoepithelial isozymes indistinguishable from those of normal rabbits. By electrophoretic methods, the mutant rabbits were shown to lack a protein band corresponding to that of the leukocytic isozyme in normal rabbits Canet et al. (1999) studied the unfolding and refolding properties of human lysozyme and 2 of its amyloidogenic variants, ile56 to thr and asp67 to his, by stopped-flow fluorescence and hydrogen exchange pulse labeling coupled with mass spectrometry. Their results suggested that the amyloidogenic nature of the lysozyme variants arises from a decrease in the stability of the native fold relative to partially folded intermediates. The origin of this instability was different in the 2 variants, being caused in one case primarily by a reduction in the folding rate and in the other by an in-

crease in the unfolding rate. In both cases, this resulted in a low population of soluble partially folded species that can aggregate in a slow and controlled manner to form amyloid fibrils

[35070] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35072] Camara, V. M.; Harding, J. W.; Prieur, D. J. : Inherited lysozyme deficiency in rabbits: the absence of a primary isozyme of lysozyme as the cause of the condition. *Lab. Invest.* 63: 544–55.

[35073] Further studies establishing the function and utilities of LYZ are found in John Hopkins OMIM database record ID 153450, and in cited publications numbered 668–67 and 5245 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RNA (guanine–7–) Methyltransferase (RNMT, Accession NM_003799) is another VGAM929 host target gene. RNMT

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9886, to the nucleotide sequence of VGAM929 RNA, herein designated VGAM RNA, also designated SEQ ID:3640.

[35074] Another function of VGAM929 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.FLJ14166 (Accession NM_024565) is another VGAM929 host target gene. FLJ14166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ14166 BINDING SITE, designated SEQ ID:23790, to the nucleotide sequence of VGAM929 RNA, herein designated VGAM RNA, also designated SEQ ID:3640.

[35075] Another function of VGAM929 is therefore inhibition of FLJ14166 (Accession NM_024565). Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14166. GRB2-associated Binding Protein 3 (GAB3, Accession NM_080612) is another VGAM929 host target gene. GAB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB3 BINDING SITE, designated SEQ ID:27927, to the nucleotide sequence of VGAM929 RNA, herein designated VGAM RNA, also designated SEQ ID:3640.

[35076] Another function of VGAM929 is therefore inhibition of GRB2-associated Binding Protein 3 (GAB3, Accession NM_080612). Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB3. KIAA1223 (Accession

XM_048747) is another VGAM929 host target gene.

KIAA1223 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1223 BINDING SITE, designated SEQ ID:35246, to the nucleotide sequence of VGAM929 RNA, herein designated VGAM RNA, also designated SEQ ID:3640.

[35077] Another function of VGAM929 is therefore inhibition of KIAA1223 (Accession XM_048747). Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1223. Leiomodin 1 (smooth muscle) (LMOD1, Accession NM_012134) is another VGAM929 host target gene. LMOD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LMOD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMOD1 BINDING SITE, designated SEQ ID:14444, to the nucleotide sequence of VGAM929 RNA,

herein designated VGAM RNA, also designated SEQ ID:3640.

[35078] Another function of VGAM929 is therefore inhibition of Leiomodin 1 (smooth muscle) (LMOD1, Accession NM_012134). Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMOD1. Stromal Antigen 2 (STAG2, Accession XM_047285) is another VGAM929 host target gene. STAG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAG2 BINDING SITE, designated SEQ ID:34929, to the nucleotide sequence of VGAM929 RNA, herein designated VGAM RNA, also designated SEQ ID:3640.

[35079] Another function of VGAM929 is therefore inhibition of Stromal Antigen 2 (STAG2, Accession XM_047285). Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAG2. LOC115129 (Accession XM_055292) is another VGAM929 host target gene. LOC115129 BIND-

ING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115129 BINDING SITE, designated SEQ ID:36250, to the nucleotide sequence of VGAM929 RNA, herein designated VGAM RNA, also designated SEQ ID:3640.

[35080] Another function of VGAM929 is therefore inhibition of LOC115129 (Accession XM_055292). Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115129. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 930 (VGAM930) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35081] VGAM930 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM930 was detected is described hereinabove with reference to Figs. 1-8.

[35082] VGAM930 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta Moorei Entomopoxvirus. VGAM930 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35083] VGAM930 gene encodes a VGAM930 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM930 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM930 precursor RNA is designated SEQ ID:916, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:916 is located at position 48640 relative to the genome of Amsacta Moorei Entomopoxvirus.

[35084] VGAM930 precursor RNA folds onto itself, forming VGAM930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[35085] An enzyme complex designated DICER COMPLEX, `dices` the VGAM930 folded precursor RNA into VGAM930 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM930 RNA is designated SEQ ID:3641, and is provided hereinbelow with reference to the sequence listing part.

[35086] VGAM930 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM930 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM930 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35087] VGAM930 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM930 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM930 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM930 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM930 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35088] The complementary binding of VGAM930 RNA, herein designated VGAM RNA, to host target binding sites on VGAM930 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM930 host target RNA into VGAM930 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35089] It is appreciated that VGAM930 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM930 host target genes. The mRNA of each one of this plurality of VGAM930 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM930 RNA, herein designated VGAM RNA, and which when bound by VGAM930 RNA causes inhibition of translation of respective one or more VGAM930 host target proteins.

[35090] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM930 gene, herein designated VGAM GENE, on one or more VGAM930 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35091] It is yet further appreciated that a function of VGAM930 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM930 include diagnosis, prevention and treatment of viral infection by Amsacta Moorei Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM930 correlate with, and may be deduced from, the identity of the host target genes which VGAM930 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35092] Nucleotide sequences of the VGAM930 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM930 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM930 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM930 are further described hereinbelow with reference to Table 1.

[35093] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM930 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM930 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35094] As mentioned hereinabove with reference to Fig. 1, a function of VGAM930 gene, herein designated VGAM is inhibition of expression of VGAM930 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM930 correlate with, and may be deduced from, the identity of the target genes which VGAM930 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35095] FLJ13391 (Accession NM_032181) is a VGAM930 host target gene. FLJ13391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ13391 BINDING SITE, designated SEQ ID:25895, to the nucleotide sequence of VGAM930 RNA, herein designated VGAM RNA, also designated SEQ ID:3641.

[35096] A function of VGAM930 is therefore inhibition of FLJ13391 (Accession NM_032181). Accordingly, utilities of VGAM930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13391. KIAA0783 (Accession NM_014660) is another VGAM930 host target gene. KIAA0783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0783 BINDING SITE, designated SEQ ID:16104, to the nucleotide sequence of VGAM930 RNA, herein designated VGAM RNA, also designated SEQ ID:3641.

[35097] Another function of VGAM930 is therefore inhibition of KIAA0783 (Accession NM_014660). Accordingly, utilities of VGAM930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0783. KIAA1209 (Accession XM_027307) is another

VGAM930 host target gene. KIAA1209 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1209 BINDING SITE, designated SEQ ID:30470, to the nucleotide sequence of VGAM930 RNA, herein designated VGAM RNA, also designated SEQ ID:3641.

[35098] Another function of VGAM930 is therefore inhibition of KIAA1209 (Accession XM_027307). Accordingly, utilities of VGAM930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1209. NX-17 (Accession NM_020665) is another VGAM930 host target gene. NX-17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NX-17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NX-17 BINDING SITE, designated SEQ ID:21834, to the nucleotide sequence of VGAM930 RNA, herein designated VGAM RNA, also designated SEQ ID:3641.

[35099] Another function of VGAM930 is therefore inhibition of NX-17 (Accession NM_020665). Accordingly, utilities of VGAM930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NX-17. PV1 (Accession NM_031310) is another VGAM930 host target gene. PV1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PV1 BINDING SITE, designated SEQ ID:25347, to the nucleotide sequence of VGAM930 RNA, herein designated VGAM RNA, also designated SEQ ID:3641.

[35100] Another function of VGAM930 is therefore inhibition of PV1 (Accession NM_031310). Accordingly, utilities of VGAM930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PV1. LOC153277 (Accession XM_098346) is another VGAM930 host target gene. LOC153277 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153277 BINDING SITE, designated SEQ ID:41603, to the nucleotide sequence of VGAM930 RNA, herein designated VGAM RNA, also designated SEQ ID:3641.

[35101] Another function of VGAM930 is therefore inhibition of LOC153277 (Accession XM_098346). Accordingly, utilities of VGAM930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153277. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 931 (VGAM931) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35102] VGAM931 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM931 was detected is described hereinabove with reference to Figs. 1-8.

[35103] VGAM931 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM931 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35104] VGAM931 gene encodes a VGAM931 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM931 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM931 precursor RNA is designated SEQ ID:917, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:917 is located at position 133625 relative to the genome of African Swine Fever Virus.

[35105] VGAM931 precursor RNA folds onto itself, forming VGAM931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35106] An enzyme complex designated DICER COMPLEX, `dices` the VGAM931 folded precursor RNA into VGAM931 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM931 RNA is designated SEQ ID:3642, and is provided hereinbelow with reference to the sequence listing part.

[35107] VGAM931 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM931 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM931 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35108] VGAM931 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM931 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM931 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM931 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM931 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35109] The complementary binding of VGAM931 RNA, herein designated VGAM RNA, to host target binding sites on VGAM931 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM931 host target RNA into VGAM931 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[35110] It is appreciated that VGAM931 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM931 host target genes. The mRNA of each one of this plurality of VGAM931 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM931 RNA, herein designated VGAM RNA, and which when bound by VGAM931 RNA causes inhibition of translation of respective one or more VGAM931 host target proteins.

[35111] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM931 gene, herein designated VGAM GENE, on one or more VGAM931 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35112] It is yet further appreciated that a function of VGAM931 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM931 correlate with, and may be deduced from, the identity of the host target genes which VGAM931 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35113] Nucleotide sequences of the VGAM931 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM931 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM931 are further described hereinbelow with reference to Table 1.

[35114] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM931 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM931 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35115] As mentioned hereinabove with reference to Fig. 1, a function of VGAM931 gene, herein designated VGAM is inhibition of expression of VGAM931 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM931 correlate with, and may be deduced from, the identity of the target genes which VGAM931 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35116] FCRH1 (Accession NM_052938) is a VGAM931 host target gene. FCRH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FCRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCRH1 BINDING SITE, designated SEQ ID:27497, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ

ID:3642.

[35117] A function of VGAM931 is therefore inhibition of FCRH1 (Accession NM_052938). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCRH1. Inhibitor of DNA Binding 4, Dominant Negative Helix-loop-helix Protein (ID4, Accession NM_001546) is another VGAM931 host target gene. ID4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ID4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ID4 BINDING SITE, designated SEQ ID:7271, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35118] Another function of VGAM931 is therefore inhibition of Inhibitor of DNA Binding 4, Dominant Negative Helix-loop-helix Protein (ID4, Accession NM_001546), a gene which negatively regulates cell differentiation. Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ID4. The function of ID4 has been established by

previous studies. Transcription factors containing a basic helix–loop–helix (bHLH) motif regulate the expression of tissue–specific genes in a number of mammalian and insect systems (Pagliuca et al., 1995). DNA–binding activity of the bHLH proteins is dependent on formation of homo– and/or heterodimers. Dominant–negative HLH proteins (encoded by Id–related genes) also contain the HLH–dimerization domain but lack the DNA–binding basic domain. Consequently, Id proteins inhibit binding to DNA and transcriptional transactivation by heterodimerization with bHLH proteins. Pagliuca et al. (1995) reported the cDNA sequence of a novel human HLH gene, to which the symbol ID4 was assigned, which lacks the basic domain. ID4 is differentially expressed in adult organs as 4 mRNA molecules that are presumably the result of differential splicing and/or alternative polyadenylation sites. Transfection experiments indicated that enforced expression of the ID4 protein inhibits the transactivation of the muscle creatine kinase (CKM; 123310) E–box enhancer by MyoD (MYOD1; 159970). By fluorescence in situ hybridization (FISH), Pagliuca et al. (1995) mapped the ID4 gene to 6p22–p21.3. By the same method, Rigolet et al. (1998) mapped the gene to 6p23–p22.3. For other dominant–neg–

active inhibitors of DNA binding, see ID1 (OMIM Ref. No. 600349), ID2 (OMIM Ref. No. 600386), and ID3 (600277

[35119] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35120] Pagliuca, A.; Bartoli, P. C.; Saccone, S.; Valle, G. D.; Lania, L. : Molecular cloning of ID4, a novel dominant negative helix-loop-helix human gene on chromosome 6p21.3-p22. Genomics 27: 200-203, 1995. ; and

[35121] Rigolet, M.; Rich, T.; Gross-Morand, M.-S.; Molina-Gomes, D.; Viegas-Pequignot, E.; Junien, C. : cDNA cloning, tissue distribution and chromosomal localization of the human ID4 gene. DNA.

[35122] Further studies establishing the function and utilities of ID4 are found in John Hopkins OMIM database record ID 600581, and in cited publications numbered 10185-10186 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protocadherin Alpha 1 (PCDHA1, Accession NM_018900) is another VGAM931 host target gene. PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA1, corresponding to HOST

TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2, designated SEQ ID:20863 and SEQ ID:25382 respectively, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35123] Another function of VGAM931 is therefore inhibition of Protocadherin Alpha 1 (PCDHA1, Accession NM_018900). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA1. Protocadherin Alpha 10 (PCDHA10, Accession NM_031860) is another VGAM931 host target gene. PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2, designated SEQ ID:25614 and SEQ ID:20883 respectively, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35124] Another function of VGAM931 is therefore inhibition of Protocadherin Alpha 10 (PCDHA10, Accession NM_031860). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA10. Protocadherin Alpha 13 (PCDHA13, Accession NM_018904) is another VGAM931 host target gene. PCDHA13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA13 BINDING SITE, designated SEQ ID:20904, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35125] Another function of VGAM931 is therefore inhibition of Protocadherin Alpha 13 (PCDHA13, Accession NM_018904). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA13. Protocadherin Alpha 2 (PCDHA2, Accession NM_018905) is another VGAM931 host target gene. PCDHA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PCDHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA2 BINDING SITE, designated SEQ ID:20914, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35126] Another function of VGAM931 is therefore inhibition of Protocadherin Alpha 2 (PCDHA2, Accession NM_018905). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA2. Protocadherin Alpha 3 (PCDHA3, Accession NM_018906) is another VGAM931 host target gene. PCDHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA3 BINDING SITE, designated SEQ ID:20924, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35127] Another function of VGAM931 is therefore inhibition of

Protocadherin Alpha 3 (PCDHA3, Accession NM_018906). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA3. Protocadherin Alpha 4 (PCDHA4, Accession NM_018907) is another VGAM931 host target gene. PCDHA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA4 BINDING SITE, designated SEQ ID:20934, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35128] Another function of VGAM931 is therefore inhibition of Protocadherin Alpha 4 (PCDHA4, Accession NM_018907). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA4. Protocadherin Alpha 5 (PCDHA5, Accession NM_018908) is another VGAM931 host target gene. PCDHA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA5, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA5 BINDING SITE, designated SEQ ID:20944, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35129] Another function of VGAM931 is therefore inhibition of Protocadherin Alpha 5 (PCDHA5, Accession NM_018908). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA5. Protocadherin Alpha 6 (PCDHA6, Accession NM_031849) is another VGAM931 host target gene. PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2, designated SEQ ID:25586 and SEQ ID:20954 respectively, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35130] Another function of VGAM931 is therefore inhibition of

Protocadherin Alpha 6 (PCDHA6, Accession NM_031849). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA6. Protocadherin Alpha 8 (PCDHA8, Accession NM_018911) is another VGAM931 host target gene. PCDHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA8 BINDING SITE, designated SEQ ID:20974, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35131] Another function of VGAM931 is therefore inhibition of Protocadherin Alpha 8 (PCDHA8, Accession NM_018911). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA8. Protocadherin Alpha 9 (PCDHA9, Accession NM_031857) is another VGAM931 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:25599, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35132] Another function of VGAM931 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_031857), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898) is another VGAM931 host target gene. PCDHAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC1 BINDING SITE, designated

SEQ ID:20843, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35133] Another function of VGAM931 is therefore inhibition of Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC1. Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899) is another VGAM931 host target gene. PCDHAC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC2 BINDING SITE, designated SEQ ID:20853, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35134] Another function of VGAM931 is therefore inhibition of Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC2. Protocadherin

Beta 16 (PCDHB16, Accession NM_020957) is another VGAM931 host target gene. PCDHB16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB16 BINDING SITE, designated SEQ ID:21944, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35135] Another function of VGAM931 is therefore inhibition of Protocadherin Beta 16 (PCDHB16, Accession NM_020957), a gene which is a potential calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB16. The function of PCDHB16 has been established by previous studies. Cadherins are calcium-dependent cell-cell adhesion molecules that mediate neural cell-cell interactions. Protocadherins constitute a subfamily of nonclassic cadherins. PCDHB16 is a member of the beta cluster of protocadherin genes on 5q31. For specific information on the PCDHB genes, see 604967. Using PCR with degenerate

primers to screen melanoma cell lines, Matsuyoshi et al. (1997) obtained a cDNA fragment encoding part of PCDHB16, which they termed ME1. RT-PCR analysis detected expression of ME1 in melanoma cell lines and normal fibroblast cell lines, but not in a squamous carcinoma cell lines or normal melanocytes, suggesting that ME1 may play a role in the strong cell-cell adhesiveness of melanoma cells.

[35136] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35137] Matsuyoshi, N.; Tanaka, T.; Toda, K.; Imamura, S. : Identification of novel cadherins expressed in human melanoma cells. J. Invest. Derm. 108: 908–913, 1997. ; and

[35138] Wu, Q.; Zhang, T.; Cheng, J.-F.; Kim, Y.; Grimwood, J.; Schmutz, J.; Dickson, M.; Noonan, J. P.; Zhang, M. Q.; Myers, R. M.; Maniatis, T. : Comparative DNA sequence analysis of mouse and.

[35139] Further studies establishing the function and utilities of PCDHB16 are found in John Hopkins OMIM database record ID 606345, and in cited publications numbered 4514, 673 and 9535 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer–

ence. Zinc Finger Protein 268 (ZNF268, Accession XM_031851) is another VGAM931 host target gene. ZNF268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF268 BINDING SITE, designated SEQ ID:31499, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35140] Another function of VGAM931 is therefore inhibition of Zinc Finger Protein 268 (ZNF268, Accession XM_031851). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF268. Chromosome 2 Open Reading Frame 6 (C2orf6, Accession NM_018221) is another VGAM931 host target gene. C2orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C2orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C2orf6 BINDING SITE,

designated SEQ ID:20141, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35141] Another function of VGAM931 is therefore inhibition of Chromosome 2 Open Reading Frame 6 (C2orf6, Accession NM_018221). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C2orf6. FLJ20086 (Accession NM_017661) is another VGAM931 host target gene. FLJ20086 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20086 BINDING SITE, designated SEQ ID:19191, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35142] Another function of VGAM931 is therefore inhibition of FLJ20086 (Accession NM_017661). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20086. FLJ20220 (Accession NM_017718) is another VGAM931

host target gene. FLJ20220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20220 BINDING SITE, designated SEQ ID:19302, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35143] Another function of VGAM931 is therefore inhibition of FLJ20220 (Accession NM_017718). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20220. FLJ20436 (Accession NM_017822) is another VGAM931 host target gene. FLJ20436 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20436 BINDING SITE, designated SEQ ID:19473, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35144] Another function of VGAM931 is therefore inhibition of FLJ20436 (Accession NM_017822). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20436. Interleukin 18 Binding Protein (IL18BP, Accession NM_005699) is another VGAM931 host target gene. IL18BP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL18BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL18BP BINDING SITE, designated SEQ ID:12250, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35145] Another function of VGAM931 is therefore inhibition of Interleukin 18 Binding Protein (IL18BP, Accession NM_005699). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL18BP. KIAA1219 (Accession XM_028835) is another VGAM931 host target gene. KIAA1219 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by KIAA1219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1219 BINDING SITE, designated SEQ ID:30757, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35146] Another function of VGAM931 is therefore inhibition of KIAA1219 (Accession XM_028835). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1219. KIAA1884 (Accession XM_055539) is another VGAM931 host target gene. KIAA1884 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1884 BINDING SITE, designated SEQ ID:36293, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35147] Another function of VGAM931 is therefore inhibition of KIAA1884 (Accession XM_055539). Accordingly, utilities

of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1884. PDP (Accession NM_018444) is another VGAM931 host target gene. PDP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDP BINDING SITE, designated SEQ ID:20514, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35148] Another function of VGAM931 is therefore inhibition of PDP (Accession NM_018444). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDP. SET Binding Protein 1 (SETBP1, Accession NM_015559) is another VGAM931 host target gene. SETBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SETBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SETBP1 BIND-

ING SITE, designated SEQ ID:17824, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35149] Another function of VGAM931 is therefore inhibition of SET Binding Protein 1 (SETBP1, Accession NM_015559). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SETBP1. LOC150358 (Accession XM_097842) is another VGAM931 host target gene. LOC150358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150358 BINDING SITE, designated SEQ ID:41158, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35150] Another function of VGAM931 is therefore inhibition of LOC150358 (Accession XM_097842). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150358. LOC155081 (Accession XM_088145) is an-

other VGAM931 host target gene. LOC155081 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155081 BINDING SITE, designated SEQ ID:39543, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35151] Another function of VGAM931 is therefore inhibition of LOC155081 (Accession XM_088145). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155081. LOC157280 (Accession XM_058301) is another VGAM931 host target gene. LOC157280 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157280 BINDING SITE, designated SEQ ID:36594, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35152] Another function of VGAM931 is therefore inhibition of LOC157280 (Accession XM_058301). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157280. LOC202802 (Accession XM_114560) is another VGAM931 host target gene. LOC202802 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202802 BINDING SITE, designated SEQ ID:42988, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35153] Another function of VGAM931 is therefore inhibition of LOC202802 (Accession XM_114560). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202802. LOC219401 (Accession XM_166706) is another VGAM931 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44589, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35154] Another function of VGAM931 is therefore inhibition of LOC219401 (Accession XM_166706). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. LOC221543 (Accession XM_168091) is another VGAM931 host target gene. LOC221543 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221543, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221543 BINDING SITE, designated SEQ ID:45011, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35155] Another function of VGAM931 is therefore inhibition of LOC221543 (Accession XM_168091). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221543. LOC222228 (Accession XM_168627) is another VGAM931 host target gene. LOC222228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222228 BINDING SITE, designated SEQ ID:45274, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35156] Another function of VGAM931 is therefore inhibition of LOC222228 (Accession XM_168627). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222228. LOC222233 (Accession XM_168560) is another VGAM931 host target gene. LOC222233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222233 BINDING SITE, designated SEQ ID:45243, to the nucleotide sequence of VGAM931 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3642.

[35157] Another function of VGAM931 is therefore inhibition of LOC222233 (Accession XM_168560). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222233. LOC254018 (Accession XM_173066) is another VGAM931 host target gene. LOC254018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254018 BINDING SITE, designated SEQ ID:46318, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35158] Another function of VGAM931 is therefore inhibition of LOC254018 (Accession XM_173066). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254018. LOC255448 (Accession XM_170623) is another VGAM931 host target gene. LOC255448 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255448, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255448 BINDING SITE, designated SEQ ID:45404, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35159] Another function of VGAM931 is therefore inhibition of LOC255448 (Accession XM_170623). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255448. LOC257596 (Accession XM_175296) is another VGAM931 host target gene. LOC257596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257596 BINDING SITE, designated SEQ ID:46752, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35160] Another function of VGAM931 is therefore inhibition of LOC257596 (Accession XM_175296). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257596. LOC91308 (Accession XM_037600) is another VGAM931 host target gene. LOC91308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91308 BINDING SITE, designated SEQ ID:32655, to the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, also designated SEQ ID:3642.

[35161] Another function of VGAM931 is therefore inhibition of LOC91308 (Accession XM_037600). Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91308. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 932 (VGAM932) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35162] VGAM932 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM932 was detected is described hereinabove with reference to Figs. 1–8.

[35163] VGAM932 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM932 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35164] VGAM932 gene encodes a VGAM932 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM932 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM932 precursor RNA is designated SEQ ID:918, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:918 is located at position 122063 relative to the genome of Human Herpesvirus 4.

[35165] VGAM932 precursor RNA folds onto itself, forming VGAM932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35166] An enzyme complex designated DICER COMPLEX, `dices` the VGAM932 folded precursor RNA into VGAM932 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM932 RNA is designated SEQ ID:3643, and is provided hereinbelow with reference to the sequence listing part.

[35167] VGAM932 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM932 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM932 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35168] VGAM932 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM932 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM932 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM932 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM932 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35169] The complementary binding of VGAM932 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM932 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM932 host target RNA into VGAM932 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35170] It is appreciated that VGAM932 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM932 host target genes. The mRNA of each one of this plurality of VGAM932 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM932 RNA, herein designated VGAM RNA, and which when bound by VGAM932 RNA causes inhibition of translation of respective one or more VGAM932 host target proteins.

[35171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM932 gene, herein designated VGAM GENE, on one or more VGAM932 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35172] It is yet further appreciated that a function of VGAM932 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM932 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM932 correlate with, and may be deduced from, the identity of the host target genes which VGAM932 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35173] Nucleotide sequences of the VGAM932 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM932 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM932 are further described hereinbelow with reference to Table 1.

[35174] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM932 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM932 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35175] As mentioned hereinabove with reference to Fig. 1, a function of VGAM932 gene, herein designated VGAM is inhibition of expression of VGAM932 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM932 correlate with, and may be deduced from, the identity of the target genes which VGAM932 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35176] PIF1 (Accession XM_027898) is a VGAM932 host target gene. PIF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

PIF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIF1 BINDING SITE, designated SEQ ID:30585, to the nucleotide sequence of VGAM932 RNA, herein designated VGAM RNA, also designated SEQ ID:3643.

[35177] A function of VGAM932 is therefore inhibition of PIF1 (Accession XM_027898). Accordingly, utilities of VGAM932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIF1. SE57-1 (Accession NM_025214) is another VGAM932 host target gene. SE57-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SE57-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE57-1 BINDING SITE, designated SEQ ID:24888, to the nucleotide sequence of VGAM932 RNA, herein designated VGAM RNA, also designated SEQ ID:3643.

[35178] Another function of VGAM932 is therefore inhibition of SE57-1 (Accession NM_025214). Accordingly, utilities of VGAM932 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SE57-1.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 933 (VGAM933) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35179] VGAM933 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM933 was detected is described hereinabove with reference to Figs. 1-8.

[35180] VGAM933 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM933 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35181] VGAM933 gene encodes a VGAM933 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM933 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM933 precursor RNA is designated SEQ ID:919, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:919 is located at position 123567 relative to the genome of Human Herpesvirus 4.

[35182] VGAM933 precursor RNA folds onto itself, forming VGAM933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35183] An enzyme complex designated DICER COMPLEX, `dices` the VGAM933 folded precursor RNA into VGAM933 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM933 RNA is designated SEQ ID:3644, and is provided hereinbelow with reference to the sequence listing part.

[35184] VGAM933 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM933 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM933 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35185] VGAM933 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM933 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM933 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM933 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM933 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35186] The complementary binding of VGAM933 RNA, herein designated VGAM RNA, to host target binding sites on VGAM933 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM933 host target RNA into VGAM933 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35187] It is appreciated that VGAM933 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM933 host target genes. The mRNA of each one of this plurality of VGAM933 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM933 RNA, herein designated VGAM RNA, and which when bound by VGAM933 RNA causes in-

hibition of translation of respective one or more VGAM933 host target proteins.

[35188] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM933 gene, herein designated VGAM GENE, on one or more VGAM933 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35189] It is yet further appreciated that a function of VGAM933 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM933 include diagnosis, prevention and

treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM933 correlate with, and may be deduced from, the identity of the host target genes which VGAM933 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35190] Nucleotide sequences of the VGAM933 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM933 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM933 are further described hereinbelow with reference to Table 1.

[35191] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM933 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM933 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35192] As mentioned hereinabove with reference to Fig. 1, a function of VGAM933 gene, herein designated VGAM is inhibition of expression of VGAM933 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM933 correlate with, and may be deduced from, the identity of the target genes which VGAM933 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35193] Ectonucleoside Triphosphate Diphosphohydrolase 6 (putative function) (ENTPD6, Accession NM_001247) is a VGAM933 host target gene. ENTPD6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENTPD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENTPD6 BINDING SITE, designated SEQ ID:6917, to the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, also designated SEQ ID:3644.

[35194] A function of VGAM933 is therefore inhibition of Ectonucleoside Triphosphate Diphosphohydrolase 6 (putative function) (ENTPD6, Accession NM_001247), a gene which might support glycosylation reactions in the golgi apparatus and, when released from cells, might catalyze the hydrolysis of extracellular nucleotides. Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ENTPD6. The function of ENTPD6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827. Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM_139177) is another VGAM933 host target gene. C17orf26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C17orf26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf26 BINDING SITE, designated SEQ ID:29185, to the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, also designated SEQ ID:3644.

[35195] Another function of VGAM933 is therefore inhibition of Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM_139177). Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf26. FLJ13265 (Accession NM_024877) is another VGAM933 host target gene. FLJ13265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ13265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13265 BINDING SITE, designated SEQ ID:24311, to the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, also designated SEQ ID:3644.

[35196] Another function of VGAM933 is therefore inhibition of FLJ13265 (Accession NM_024877). Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13265. Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM_029962) is another VGAM933 host target gene. KCNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNT1 BINDING SITE, designated SEQ ID:30973, to the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, also designated SEQ ID:3644.

[35197] Another function of VGAM933 is therefore inhibition of

Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM_029962). Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNT1. KIAA1493 (Accession XM_034415) is another VGAM933 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32092, to the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, also designated SEQ ID:3644.

[35198] Another function of VGAM933 is therefore inhibition of KIAA1493 (Accession XM_034415). Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. LOC113230 (Accession XM_053966) is another VGAM933 host target gene. LOC113230 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC113230, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113230 BINDING SITE, designated SEQ ID:36131, to the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, also designated SEQ ID:3644.

[35199] Another function of VGAM933 is therefore inhibition of LOC113230 (Accession XM_053966). Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113230. LOC115399 (Accession XM_055874) is another VGAM933 host target gene. LOC115399 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115399 BINDING SITE, designated SEQ ID:36347, to the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, also designated SEQ ID:3644.

[35200] Another function of VGAM933 is therefore inhibition of LOC115399 (Accession XM_055874). Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC115399. LOC147817 (Accession XM_085903) is another VGAM933 host target gene. LOC147817 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147817 BINDING SITE, designated SEQ ID:38387, to the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, also designated SEQ ID:3644.

[35201] Another function of VGAM933 is therefore inhibition of LOC147817 (Accession XM_085903). Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147817. LOC148147 (Accession XM_086071) is another VGAM933 host target gene. LOC148147 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148147 BINDING SITE, designated SEQ ID:38474, to the nucleotide sequence of VGAM933 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3644.

[35202] Another function of VGAM933 is therefore inhibition of LOC148147 (Accession XM_086071). Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148147. LOC163412 (Accession XM_088868) is another VGAM933 host target gene. LOC163412 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163412, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163412 BINDING SITE, designated SEQ ID:39953, to the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, also designated SEQ ID:3644.

[35203] Another function of VGAM933 is therefore inhibition of LOC163412 (Accession XM_088868). Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163412. LOC58525 (Accession XM_086045) is another VGAM933 host target gene. LOC58525 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC58525, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58525 BINDING SITE, designated SEQ ID:38457, to the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, also designated SEQ ID:3644.

[35204] Another function of VGAM933 is therefore inhibition of LOC58525 (Accession XM_086045). Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58525. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 934 (VGAM934) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35205] VGAM934 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM934 was detected is described hereinabove with reference to Figs. 1–8.

[35206] VGAM934 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4.

VGAM934 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35207] VGAM934 gene encodes a VGAM934 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM934 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM934 precursor RNA is designated SEQ ID:920, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:920 is located at position 123384 relative to the genome of Human Herpesvirus 4.

[35208] VGAM934 precursor RNA folds onto itself, forming VGAM934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35209] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM934 folded precursor RNA into VGAM934 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM934 RNA is designated SEQ ID:3645, and is provided hereinbelow with reference to the sequence listing part.

[35210] VGAM934 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM934 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM934 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35211] VGAM934 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM934 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM934 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM934 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM934 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35212] The complementary binding of VGAM934 RNA, herein designated VGAM RNA, to host target binding sites on VGAM934 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM934 host target RNA into VGAM934 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35213] It is appreciated that VGAM934 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM934 host target genes. The mRNA of each one of this plurality of VGAM934 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM934 RNA, herein designated VGAM RNA, and which when bound by VGAM934 RNA causes inhibition of translation of respective one or more VGAM934 host target proteins.

[35214] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM934 gene, herein designated VGAM GENE, on one or more VGAM934 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35215] It is yet further appreciated that a function of VGAM934 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM934 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM934 correlate with, and may be deduced from, the identity of the host target genes which VGAM934 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35216] Nucleotide sequences of the VGAM934 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM934 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM934 are further described hereinbelow with reference to Table 1.

[35217] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM934 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM934 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35218] As mentioned hereinabove with reference to Fig. 1, a function of VGAM934 gene, herein designated VGAM is inhibition of expression of VGAM934 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM934 correlate with, and may be deduced from, the identity of the target genes which VGAM934 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35219] Splicing Factor 1 (SF1, Accession NM_004630) is a VGAM934 host target gene. SF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SF1 BINDING SITE, designated SEQ ID:11003, to the nucleotide sequence of

VGAM934 RNA, herein designated VGAM RNA, also designated SEQ ID:3645.

[35220] A function of VGAM934 is therefore inhibition of Splicing Factor 1 (SF1, Accession NM_004630), a gene which is a transcriptional repressor and splicing factor. Accordingly, utilities of VGAM934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SF1. The function of SF1 has been established by previous studies. Toda et al. (1994) isolated a gene, designated ZFM1 by them, from cosmids from the MEN1 (OMIM Ref. No. 131100) region of 11q13 using exon amplification. They then obtained cDNAs from cerebral, cerebellar, and fetal liver libraries. The predicted 623-amino acid protein contains a nuclear transport domain, a metal-binding or zinc finger motif, and glutamine- and proline-rich regions. It shows some sequence similarity to WT1 (OMIM Ref. No. 607102) and EGR2 (OMIM Ref. No. 129010). RT-PCR was used to show expression in the thyroid gland, pancreas, adrenal gland, and ovary. By differential screening of a cDNA library obtained from GMCSF (OMIM Ref. No. 138960)-stimulated human myeloid leukemia cells, Caslini et al. (1997) cloned 2 additional isoforms of the ZNF162 gene, designated B3 and B4, that

encode 571- and 639-amino acid proteins, respectively. All of the ZNF162 isoforms contain a KH domain, a sequence motif present in proteins playing a major role in regulating cellular RNA metabolism.

[35221] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35222] Toda, T.; Iida, A.; Miwa, T.; Nakamura, Y.; Imai, T. : Isolation and characterization of a novel gene encoding nuclear protein at a locus (D11S636) tightly linked to multiple endocrine neoplasia type 1 (MEN1). Hum. Molec. Genet. 3: 465-470, 1994. ; and

[35223] Caslini, C.; Spinelli, O.; Cazzaniga, G.; Golay, J.; De Gioia, L.; Pedretti, A.; Breviario, F.; Amaru, R.; Barbui, T.; Biondi, A.; Introna, M.; Rambaldi, A. : Identification of two novel is.

[35224] Further studies establishing the function and utilities of SF1 are found in John Hopkins OMIM database record ID 601516, and in cited publications numbered 2776, 398 and 6654 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ22002 (Accession NM_024838) is another VGAM934 host target gene. FLJ22002 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by FLJ22002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22002 BINDING SITE, designated SEQ ID:24244, to the nucleotide sequence of VGAM934 RNA, herein designated VGAM RNA, also designated SEQ ID:3645.

[35225] Another function of VGAM934 is therefore inhibition of FLJ22002 (Accession NM_024838). Accordingly, utilities of VGAM934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22002. Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635) is another VGAM934 host target gene. P2RX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P2RX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RX1 BINDING SITE, designated SEQ ID:33349, to the nucleotide sequence of VGAM934 RNA, herein designated VGAM RNA, also designated SEQ ID:3645.

[35226] Another function of VGAM934 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635). Accordingly, utilities of VGAM934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX1. LOC255598 (Accession XM_173715) is another VGAM934 host target gene. LOC255598 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255598 BINDING SITE, designated SEQ ID:46558, to the nucleotide sequence of VGAM934 RNA, herein designated VGAM RNA, also designated SEQ ID:3645.

[35227] Another function of VGAM934 is therefore inhibition of LOC255598 (Accession XM_173715). Accordingly, utilities of VGAM934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255598. LOC257103 (Accession XM_170982) is another VGAM934 host target gene. LOC257103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257103, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257103 BINDING SITE, designated SEQ ID:45753, to the nucleotide sequence of VGAM934 RNA, herein designated VGAM RNA, also designated SEQ ID:3645.

[35228] Another function of VGAM934 is therefore inhibition of LOC257103 (Accession XM_170982). Accordingly, utilities of VGAM934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257103. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 935 (VGAM935) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35229] VGAM935 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM935 was detected is described hereinabove with reference to Figs. 1–8.

[35230] VGAM935 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Melanoplus Sanguinipes*

Entomopoxvirus. VGAM935 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35231] VGAM935 gene encodes a VGAM935 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM935 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM935 precursor RNA is designated SEQ ID:921, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:921 is located at position 137342 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[35232] VGAM935 precursor RNA folds onto itself, forming VGAM935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35233] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM935 folded precursor RNA into VGAM935 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM935 RNA is designated SEQ ID:3646, and is provided hereinbelow with reference to the sequence listing part.

[35234] VGAM935 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM935 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM935 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35235] VGAM935 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM935 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM935 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM935 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM935 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35236] The complementary binding of VGAM935 RNA, herein designated VGAM RNA, to host target binding sites on VGAM935 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM935 host target RNA into VGAM935 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35237] It is appreciated that VGAM935 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM935 host target genes. The mRNA of each one of this plurality of VGAM935 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM935 RNA, herein designated VGAM RNA, and which when bound by VGAM935 RNA causes inhibition of translation of respective one or more VGAM935 host target proteins.

[35238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM935 gene, herein designated VGAM GENE, on one or more VGAM935 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35239] It is yet further appreciated that a function of VGAM935 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM935 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM935 correlate with, and may be deduced from, the identity of the host target genes which VGAM935 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35240] Nucleotide sequences of the VGAM935 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM935 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM935 are further described hereinbelow with reference to Table 1.

[35241] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM935 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM935 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35242] As mentioned hereinabove with reference to Fig. 1, a function of VGAM935 gene, herein designated VGAM is inhibition of expression of VGAM935 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM935 correlate with, and may be deduced from, the identity of the target genes which VGAM935 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35243] Translocase of Inner Mitochondrial Membrane 8 Homolog A (yeast) (TIMM8A, Accession NM_004085) is a VGAM935 host target gene. TIMM8A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIMM8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMM8A BINDING SITE,

designated SEQ ID:10289, to the nucleotide sequence of VGAM935 RNA, herein designated VGAM RNA, also designated SEQ ID:3646.

[35244] A function of VGAM935 is therefore inhibition of Translocase of Inner Mitochondrial Membrane 8 Homolog A (yeast) (TIMM8A, Accession NM_004085). Accordingly, utilities of VGAM935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM8A. BDG-29 (Accession XM_051343) is another VGAM935 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:35813, to the nucleotide sequence of VGAM935 RNA, herein designated VGAM RNA, also designated SEQ ID:3646.

[35245] Another function of VGAM935 is therefore inhibition of BDG-29 (Accession XM_051343). Accordingly, utilities of VGAM935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDG-29. Chromosome 1 Open Reading Frame 26 (C1orf26, Acces-

sion NM_017673) is another VGAM935 host target gene. C1orf26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf26 BINDING SITE, designated SEQ ID:19217, to the nucleotide sequence of VGAM935 RNA, herein designated VGAM RNA, also designated SEQ ID:3646.

[35246] Another function of VGAM935 is therefore inhibition of Chromosome 1 Open Reading Frame 26 (C1orf26, Accession NM_017673). Accordingly, utilities of VGAM935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf26. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 936 (VGAM936) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35247] VGAM936 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM936 was detected is described hereinabove with reference to Figs. 1–8.

[35248] VGAM936 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM936 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35249] VGAM936 gene encodes a VGAM936 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM936 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM936 precursor RNA is designated SEQ ID:922, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:922 is located at position 139973 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[35250] VGAM936 precursor RNA folds onto itself, forming VGAM936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35251] An enzyme complex designated DICER COMPLEX, `dices` the VGAM936 folded precursor RNA into VGAM936 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM936 RNA is designated SEQ ID:3647, and is provided hereinbelow with reference to the sequence listing part.

[35252] VGAM936 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM936 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM936 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35253] VGAM936 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM936 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM936 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM936 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM936 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[35254] The complementary binding of VGAM936 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM936 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM936 host target RNA into VGAM936 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35255] It is appreciated that VGAM936 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM936 host target genes. The mRNA of each one of this plurality of VGAM936 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM936 RNA, herein designated VGAM RNA, and which when bound by VGAM936 RNA causes inhibition of translation of respective one or more VGAM936 host target proteins.

[35256] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM936 gene, herein designated VGAM GENE, on one or more VGAM936 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35257] It is yet further appreciated that a function of VGAM936 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM936 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM936 correlate with, and may be deduced from, the identity of the host target genes which VGAM936 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35258] Nucleotide sequences of the VGAM936 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM936 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM936 are further described hereinbelow with reference to Table 1.

[35259] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM936 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM936 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35260] As mentioned hereinabove with reference to Fig. 1, a function of VGAM936 gene, herein designated VGAM is inhibition of expression of VGAM936 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM936 correlate with, and may be deduced from, the identity of the target genes which VGAM936 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35261] DKFZp547A023 (Accession XM_052065) is a VGAM936 host target gene. DKFZp547A023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547A023, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547A023 BINDING SITE, designated SEQ ID:35943, to the nucleotide sequence of VGAM936 RNA, herein designated VGAM RNA, also designated SEQ ID:3647.

[35262] A function of VGAM936 is therefore inhibition of DKFZp547A023 (Accession XM_052065). Accordingly, utilities of VGAM936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547A023. DKFZP564O123 (Accession XM_002810) is another VGAM936 host target gene. DKFZP564O123 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O123 BINDING SITE, designated SEQ ID:29906, to the nucleotide sequence of VGAM936 RNA, herein designated VGAM RNA, also designated SEQ ID:3647.

[35263] Another function of VGAM936 is therefore inhibition of DKFZP564O123 (Accession XM_002810). Accordingly,

utilities of VGAM936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O123. Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353) is another VGAM936 host target gene. ZDHHC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZDHHC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC2 BINDING SITE, designated SEQ ID:18490, to the nucleotide sequence of VGAM936 RNA, herein designated VGAM RNA, also designated SEQ ID:3647.

[35264] Another function of VGAM936 is therefore inhibition of Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353). Accordingly, utilities of VGAM936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2. LOC129446 (Accession XM_072203) is another VGAM936 host target gene. LOC129446 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129446 BINDING SITE, designated SEQ ID:37468, to the nucleotide sequence of VGAM936 RNA, herein designated VGAM RNA, also designated SEQ ID:3647.

[35265] Another function of VGAM936 is therefore inhibition of LOC129446 (Accession XM_072203). Accordingly, utilities of VGAM936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129446. LOC149722 (Accession XM_097709) is another VGAM936 host target gene. LOC149722 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149722 BINDING SITE, designated SEQ ID:41044, to the nucleotide sequence of VGAM936 RNA, herein designated VGAM RNA, also designated SEQ ID:3647.

[35266] Another function of VGAM936 is therefore inhibition of LOC149722 (Accession XM_097709). Accordingly, utilities of VGAM936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149722. LOC151414 (Accession XM_087197) is another VGAM936 host target gene. LOC151414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151414 BINDING SITE, designated SEQ ID:39113, to the nucleotide sequence of VGAM936 RNA, herein designated VGAM RNA, also designated SEQ ID:3647.

[35267] Another function of VGAM936 is therefore inhibition of LOC151414 (Accession XM_087197). Accordingly, utilities of VGAM936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151414. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 937 (VGAM937) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35268] VGAM937 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM937 was detected is described hereinabove with reference to Figs. 1–8.

[35269] VGAM937 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM937 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35270] VGAM937 gene encodes a VGAM937 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM937 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM937 precursor RNA is designated SEQ ID:923, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:923 is located at position 139184 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[35271] VGAM937 precursor RNA folds onto itself, forming VGAM937 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35272] An enzyme complex designated DICER COMPLEX, `dices` the VGAM937 folded precursor RNA into VGAM937 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM937 RNA is designated SEQ ID:3648, and is provided hereinbelow with reference to the sequence listing part.

[35273] VGAM937 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM937 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM937 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35274] VGAM937 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM937 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM937 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM937 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM937 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[35275] The complementary binding of VGAM937 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM937 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM937 host target RNA into VGAM937 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35276] It is appreciated that VGAM937 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM937 host target genes. The mRNA of each one of this plurality of VGAM937 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM937 RNA, herein designated VGAM RNA, and which when bound by VGAM937 RNA causes inhibition of translation of respective one or more VGAM937 host target proteins.

[35277] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM937 gene, herein designated VGAM GENE, on one or more VGAM937 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35278] It is yet further appreciated that a function of VGAM937 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM937 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM937 correlate with, and may be deduced from, the identity of the host target genes which VGAM937 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35279] Nucleotide sequences of the VGAM937 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM937 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM937 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM937 are further described hereinbelow with reference to Table 1.

[35280] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM937 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM937 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35281] As mentioned hereinabove with reference to Fig. 1, a function of VGAM937 gene, herein designated VGAM is inhibition of expression of VGAM937 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM937 correlate with, and may be deduced from, the identity of the target genes which VGAM937 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35282] Butyrophilin, Subfamily 3, Member A3 (BTN3A3, Accession NM_006994) is a VGAM937 host target gene. BTN3A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN3A3,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN3A3 BINDING SITE, designated SEQ ID:13856, to the nucleotide sequence of VGAM937 RNA, herein designated VGAM RNA, also designated SEQ ID:3648.

[35283] A function of VGAM937 is therefore inhibition of Butyrophilin, Subfamily 3, Member A3 (BTN3A3, Accession NM_006994). Accordingly, utilities of VGAM937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A3. FENS-1 (Accession NM_020830) is another VGAM937 host target gene. FENS-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FENS-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FENS-1 BINDING SITE, designated SEQ ID:21893, to the nucleotide sequence of VGAM937 RNA, herein designated VGAM RNA, also designated SEQ ID:3648.

[35284] Another function of VGAM937 is therefore inhibition of FENS-1 (Accession NM_020830). Accordingly, utilities of

VGAM937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FENS-1. KIAA1164 (Accession XM_045358) is another VGAM937 host target gene. KIAA1164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1164 BINDING SITE, designated SEQ ID:34440, to the nucleotide sequence of VGAM937 RNA, herein designated VGAM RNA, also designated SEQ ID:3648.

[35285] Another function of VGAM937 is therefore inhibition of KIAA1164 (Accession XM_045358). Accordingly, utilities of VGAM937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1164. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 938 (VGAM938) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35286] VGAM938 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM938 was detected is described hereinabove with reference to Figs. 1–8.

[35287] VGAM938 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Soil–borne Mosaic Virus. VGAM938 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35288] VGAM938 gene encodes a VGAM938 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM938 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM938 precursor RNA is designated SEQ ID:924, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:924 is located at position 709 relative to the genome of Beet Soil–borne Mosaic Virus.

[35289] VGAM938 precursor RNA folds onto itself, forming VGAM938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35290] An enzyme complex designated DICER COMPLEX, `dices` the VGAM938 folded precursor RNA into VGAM938 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM938 RNA is designated SEQ ID:3649, and is provided hereinbelow with reference to the sequence listing part.

[35291] VGAM938 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM938 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM938 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[35292] VGAM938 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM938 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM938 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM938 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM938 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35293] The complementary binding of VGAM938 RNA, herein designated VGAM RNA, to host target binding sites on VGAM938 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM938 host target RNA into VGAM938 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35294] It is appreciated that VGAM938 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM938 host target genes. The mRNA of each one of this plurality of VGAM938 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM938 RNA, herein designated VGAM RNA, and which when bound by VGAM938 RNA causes inhibition of translation of respective one or more VGAM938 host target proteins.

[35295] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM938 gene, herein designated VGAM GENE, on one or more VGAM938 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35296] It is yet further appreciated that a function of VGAM938 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM938 include diagnosis, prevention and treatment of viral infection by Beet Soil-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM938 correlate with, and may be deduced from, the identity of the host target genes which VGAM938 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35297] Nucleotide sequences of the VGAM938 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM938 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM938 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM938 are further
described hereinbelow with reference to Table 1.

[35298] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM938 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM938 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[35299] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM938 gene, herein designated VGAM is
inhibition of expression of VGAM938 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM938 correlate with, and may be deduced
from, the identity of the target genes which VGAM938
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[35300] Protein Kinase, CAMP-dependent, Regulatory, Type II, Beta
(PRKAR2B, Accession NM_002736) is a VGAM938 host tar-

get gene. PRKAR2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKAR2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAR2B BINDING SITE, designated SEQ ID:8612, to the nucleotide sequence of VGAM938 RNA, herein designated VGAM RNA, also designated SEQ ID:3649.

[35301] A function of VGAM938 is therefore inhibition of Protein Kinase, CAMP-dependent, Regulatory, Type II, Beta (PRKAR2B, Accession NM_002736), a gene which type ii regulatory chains mediate membrane association by binding to anchoring proteins, including the map2 kinase. Accordingly, utilities of VGAM938 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAR2B. The function of PRKAR2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.LOC154789 (Accession XM_088043) is another VGAM938 host target gene. LOC154789 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by LOC154789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154789 BINDING SITE, designated SEQ ID:39486, to the nucleotide sequence of VGAM938 RNA, herein designated VGAM RNA, also designated SEQ ID:3649.

[35302] Another function of VGAM938 is therefore inhibition of LOC154789 (Accession XM_088043). Accordingly, utilities of VGAM938 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154789. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 939 (VGAM939) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35303] VGAM939 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM939 was detected is described hereinabove with reference to Figs. 1–8.

[35304] VGAM939 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Beet Soil-borne Mosaic Virus. VGAM939 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35305] VGAM939 gene encodes a VGAM939 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM939 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM939 precursor RNA is designated SEQ ID:925, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:925 is located at position 1784 relative to the genome of Beet Soil-borne Mosaic Virus.

[35306] VGAM939 precursor RNA folds onto itself, forming VGAM939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35307] An enzyme complex designated DICER COMPLEX, `dices` the VGAM939 folded precursor RNA into VGAM939 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM939 RNA is designated SEQ ID:3650, and is provided hereinbelow with reference to the sequence listing part.

[35308] VGAM939 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM939 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM939 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35309] VGAM939 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM939 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM939 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM939 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM939 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35310] The complementary binding of VGAM939 RNA, herein designated VGAM RNA, to host target binding sites on VGAM939 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM939 host tar–

get RNA into VGAM939 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35311] It is appreciated that VGAM939 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM939 host target genes. The mRNA of each one of this plurality of VGAM939 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM939 RNA, herein designated VGAM RNA, and which when bound by VGAM939 RNA causes inhibition of translation of respective one or more VGAM939 host target proteins.

[35312] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM939 gene, herein designated VGAM GENE, on one or more VGAM939 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35313] It is yet further appreciated that a function of VGAM939 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of viral infection by Beet Soil-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM939 correlate with, and may be deduced from, the identity of the host target genes which VGAM939 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35314] Nucleotide sequences of the VGAM939 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM939 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM939 are further

described hereinbelow with reference to Table 1.

[35315] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM939 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM939 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35316] As mentioned hereinabove with reference to Fig. 1, a function of VGAM939 gene, herein designated VGAM is inhibition of expression of VGAM939 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM939 correlate with, and may be deduced from, the identity of the target genes which VGAM939 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35317] A Disintegrin and Metalloproteinase Domain 28 (ADAM28, Accession NM_014265) is a VGAM939 host target gene. ADAM28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ADAM28 BINDING SITE, designated SEQ ID:15540, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35318] A function of VGAM939 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 28 (ADAM28, Accession NM_014265), a gene which Member of the MDC family of metalloproteinases. Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM28. The function of ADAM28 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM608. Inducible T-cell Co-stimulator (ICOS, Accession NM_012092) is another VGAM939 host target gene. ICOS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICOS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICOS BINDING SITE, designated SEQ ID:14390, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35319] Another function of VGAM939 is therefore inhibition of Inducible T-cell Co-stimulator (ICOS, Accession NM_012092), a gene which forms homodimers and functions as an inducible T-cell co-stimulator. Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICOS. The function of ICOS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18. Tumor Necrosis Factor Receptor Superfamily, Member 1B (TNFRSF1B, Accession NM_001066) is another VGAM939 host target gene. TNFRSF1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF1B BINDING SITE, designated SEQ ID:6734, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35320] Another function of VGAM939 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 1B (TNFRSF1B, Accession NM_001066), a gene which medi-

ates proinflammatory cellular responses. Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF1B. The function of TNFRSF1B has been established by previous studies. Preassembly or self-association of cytokine receptor dimers (e.g., OMIM Ref. No. 147810; IL2R, 147730; and EPOR, 133171) occurs via the same amino acid contacts that are critical for ligand binding. Chan et al. (2000) found that, in contrast, the p60 (TNFRSF1A; 191190) and p80 (TNFRSF1B) TNFA receptors self-assemble through a distinct functional domain in the TNFR extracellular domain, termed the pre-ligand assembly domain (PLAD), in the absence of ligand. Deletion of the PLAD results in monomeric presentation of p60 or p80. Flow cytometric analysis showed that efficient TNFA binding depends on receptor self-assembly. They also found that other members of the TNF receptor superfamily, including the extracellular domains of TRAIL (TNFRSF10A; 603611), CD40 (TNFRSF5; 109535), and FAS (TNFRSF6; 134637), all self-associate but do not interact with heterologous receptors. Using Jurkat T cells, which express TNFR1 but little TNFR2, and Jurkat cells stably transfected with TNFR2, Li et al. (2002) confirmed that

TNF stimulation, or stimulation with a TNFR2, but not TNFR1, agonist, causes a loss of TRAF2 (OMIM Ref. No. 601895) in the TNFR2-expressing cells, but not the parental cell line, through a ubiquitination- and proteasome-dependent process. Binding analysis indicated that TRAF2 interacts with CIAP1 (OMIM Ref. No. 601712) and CIAP2 (OMIM Ref. No. 601721), which possess E3 ubiquitin ligase (e.g. UBE3A, 601623) activity. Ubiquitination assays and SDS-PAGE analysis showed that in the presence of an E2-conjugating enzyme (e.g., UBCH7, 603721), CIAP1, but not CIAP2, induces TRAF2 ubiquitination outside of its RING domain. Both CIAPs bind but neither ubiquitinates TRAF1 (OMIM Ref. No. 601711). CIAP1 expression fails to protect TNFR2-expressing cells from TNF-induced apoptosis, whereas an E3-inactive CIAP1 mutant and wildtype CIAP2 do protect cells from TRAF2 downregulation and cause a delay in cell death. Li et al. (2002) concluded that TNFR2 stimulation causes the ubiquitination of TRAF2 by CIAP1, which can play a proapoptotic role in TNF signaling. Animal model experiments lend further support to the function of TNFRSF1B. Bruce et al. (1996) used targeted gene disruption to generate mice lacking either the p55 (TNFR1) or the p75 (TNFR2) TNF re-

ceptor; mice lacking both p55 and p75 were generated from crosses of the singly deficient mice. The TNFR-deficient (TNFR-KO) mice exhibited no overt phenotype under unchallenged conditions. Bruce et al. (1996) reported that damage to neurons caused by focal cerebral ischemia and epileptic seizures was exacerbated in the TNFR-KO mice, indicating that TNF serves a neuroprotective function. Their studies indicated that TNF protects neurons by stimulating antioxidative pathways. Injury-induced microglial activation was suppressed in TNFR-KO mice. They concluded that drugs which target TNF signaling pathways may prove beneficial in treating stroke or traumatic brain injury.

[35321] It is appreciated that the abovementioned animal model for TNFRSF1B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[35322] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35323] Chan, F. K.-M.; Chun, H. J.; Zheng, L.; Siegel, R. M.; Bui, K. L.; Lenardo, M. J. : A domain in TNF receptors that mediates ligand-independent receptor assembly and signaling.

Science 288: 2351–2354, 2000. ; and

[35324] Li, X.; Yang, Y.; Ashwell, J. D. : TNF–RII and c–IAP1 mediate ubiquitination and degradation of TRAF2. Nature 416: 345–349, 2002.

[35325] Further studies establishing the function and utilities of TNFRSF1B are found in John Hopkins OMIM database record ID 191191, and in cited publications numbered 2048, 9573, 11502–1182, 1176, 1183, 1054 and 10543 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Alpha 1,4–galactosyltransferase (A4GALT, Accession NM_017436) is another VGAM939 host target gene. A4GALT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by A4GALT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A4GALT BINDING SITE, designated SEQ ID:18894, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35326] Another function of VGAM939 is therefore inhibition of Alpha 1,4–galactosyltransferase (A4GALT, Accession

NM_017436). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A4GALT. Apg4B (Accession NM_013325) is another VGAM939 host target gene.

Apg4B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Apg4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Apg4B BINDING SITE, designated SEQ ID:14974, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35327] Another function of VGAM939 is therefore inhibition of Apg4B (Accession NM_013325). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Apg4B. FLJ22405 (Accession NM_022485) is another VGAM939 host target gene. FLJ22405 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ22405 BINDING SITE, designated SEQ ID:22863, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35328] Another function of VGAM939 is therefore inhibition of FLJ22405 (Accession NM_022485). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22405. HGC6.2 (Accession NM_014356) is another VGAM939 host target gene. HGC6.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGC6.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGC6.2 BINDING SITE, designated SEQ ID:15687, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35329] Another function of VGAM939 is therefore inhibition of HGC6.2 (Accession NM_014356). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGC6.2. HRD1 (Accession XM_045498) is another VGAM939 host

target gene. HRD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRD1 BINDING SITE, designated SEQ ID:34472, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35330] Another function of VGAM939 is therefore inhibition of HRD1 (Accession XM_045498). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRD1. OS4 (Accession NM_005730) is another VGAM939 host target gene. OS4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OS4 BINDING SITE, designated SEQ ID:12289, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35331] Another function of VGAM939 is therefore inhibition of OS4 (Accession NM_005730). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OS4. LOC115557 (Accession NM_133483) is another VGAM939 host target gene. LOC115557 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115557 BINDING SITE, designated SEQ ID:28556, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35332] Another function of VGAM939 is therefore inhibition of LOC115557 (Accession NM_133483). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115557. LOC124976 (Accession XM_058879) is another VGAM939 host target gene. LOC124976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124976, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124976 BINDING SITE, designated SEQ ID:36781, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35333] Another function of VGAM939 is therefore inhibition of LOC124976 (Accession XM_058879). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124976. LOC148343 (Accession XM_086150) is another VGAM939 host target gene. LOC148343 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148343 BINDING SITE, designated SEQ ID:38521, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35334] Another function of VGAM939 is therefore inhibition of LOC148343 (Accession XM_086150). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148343. LOC150175 (Accession XM_086806) is another VGAM939 host target gene. LOC150175 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150175 BINDING SITE, designated SEQ ID:38883, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35335] Another function of VGAM939 is therefore inhibition of LOC150175 (Accession XM_086806). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150175. LOC150215 (Accession XM_086813) is another VGAM939 host target gene. LOC150215 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150215 BINDING SITE, designated SEQ ID:38887, to the nucleotide sequence of VGAM939 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3650.

[35336] Another function of VGAM939 is therefore inhibition of LOC150215 (Accession XM_086813). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150215. LOC150218 (Accession XM_086850) is another VGAM939 host target gene. LOC150218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150218 BINDING SITE, designated SEQ ID:38914, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35337] Another function of VGAM939 is therefore inhibition of LOC150218 (Accession XM_086850). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150218. LOC152002 (Accession XM_087360) is another VGAM939 host target gene. LOC152002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152002, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152002 BINDING SITE, designated SEQ ID:39195, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35338] Another function of VGAM939 is therefore inhibition of LOC152002 (Accession XM_087360). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152002. LOC152765 (Accession XM_087519) is another VGAM939 host target gene. LOC152765 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:39312, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35339] Another function of VGAM939 is therefore inhibition of LOC152765 (Accession XM_087519). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC152765. LOC166979 (Accession XM_094210) is another VGAM939 host target gene. LOC166979 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC166979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166979 BINDING SITE, designated SEQ ID:40225, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35340] Another function of VGAM939 is therefore inhibition of LOC166979 (Accession XM_094210). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166979. LOC196746 (Accession XM_113595) is another VGAM939 host target gene. LOC196746 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196746 BINDING SITE, designated SEQ ID:42289, to

the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35341] Another function of VGAM939 is therefore inhibition of LOC196746 (Accession XM_113595). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196746. LOC253962 (Accession XM_172968) is another VGAM939 host target gene. LOC253962 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253962 BINDING SITE, designated SEQ ID:46224, to the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, also designated SEQ ID:3650.

[35342] Another function of VGAM939 is therefore inhibition of LOC253962 (Accession XM_172968). Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253962. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 940 (VGAM940) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35343] VGAM940 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM940 was detected is described hereinabove with reference to Figs. 1–8.

[35344] VGAM940 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Soil-borne Mosaic Virus. VGAM940 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35345] VGAM940 gene encodes a VGAM940 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM940 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM940 precursor RNA is designated SEQ ID:926, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:926 is located at position 2221 relative to the genome of Beet Soil-borne Mosaic Virus.

[35346] VGAM940 precursor RNA folds onto itself, forming VGAM940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35347] An enzyme complex designated DICER COMPLEX, `dices` the VGAM940 folded precursor RNA into VGAM940 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM940 RNA is designated SEQ ID:3651, and is provided hereinbelow with reference to the sequence listing part.

[35348] VGAM940 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM940 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM940 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35349] VGAM940 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM940 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM940 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM940 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM940 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[35350] The complementary binding of VGAM940 RNA, herein designated VGAM RNA, to host target binding sites on VGAM940 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM940 host target RNA into VGAM940 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35351] It is appreciated that VGAM940 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM940 host target genes. The mRNA of each one of this plurality of VGAM940 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM940 RNA, herein designated VGAM RNA, and which when bound by VGAM940 RNA causes inhibition of translation of respective one or more VGAM940 host target proteins.

[35352] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM940 gene, herein designated VGAM GENE, on one or more VGAM940 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35353] It is yet further appreciated that a function of VGAM940 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of viral infection by Beet Soil-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM940 correlate with, and may be deduced from, the

identity of the host target genes which VGAM940 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35354] Nucleotide sequences of the VGAM940 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM940 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM940 are further described hereinbelow with reference to Table 1.

[35355] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM940 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM940 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35356] As mentioned hereinabove with reference to Fig. 1, a function of VGAM940 gene, herein designated VGAM is inhibition of expression of VGAM940 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM940 correlate with, and may be deduced from, the identity of the target genes which VGAM940

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35357] B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633) is a VGAM940 host target gene. BCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6257, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35358] A function of VGAM940 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. CAMP Responsive Element Binding Protein-like 2 (CREBL2, Accession NM_001310) is another VGAM940 host target gene. CREBL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CREBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CREBL2 BINDING SITE, designated SEQ ID:6258, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

tarity of the nucleotide sequences of CREBL2 BINDING SITE, designated SEQ ID:6992, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35359] Another function of VGAM940 is therefore inhibition of CAMP Responsive Element Binding Protein-like 2 (CREBL2, Accession NM_001310). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREBL2. Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_004007) is another VGAM940 host target gene. DMD BINDING SITE1 and DMD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 and DMD BINDING SITE2, designated SEQ ID:10162 and SEQ ID:10176 respectively, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35360] Another function of VGAM940 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker

types) (DMD, Accession NM_004007), a gene which muscular dystrophy . Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218. Myotubularin Related Protein 8 (MTMR8, Accession NM_015458) is another VGAM940 host target gene. MTMR8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17740, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35361] Another function of VGAM940 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM_015458), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with MTMR8. The function of MTMR8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379. Tec Protein Tyrosine Kinase (TEC, Accession NM_003215) is another VGAM940 host target gene. TEC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEC BINDING SITE, designated SEQ ID:9215, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35362] Another function of VGAM940 is therefore inhibition of Tec Protein Tyrosine Kinase (TEC, Accession NM_003215). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEC. Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM_001243) is another VGAM940 host target gene. TNFRSF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFRSF8, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF8 BINDING SITE, designated SEQ ID:6907, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35363] Another function of VGAM940 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM_001243), a gene which regulates gene expression through activation of nf-kappab. Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF8. The function of TNFRSF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM154. Zinc Finger Protein (C2H2 type) 277 (ZNF277, Accession NM_021994) is another VGAM940 host target gene. ZNF277 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF277

BINDING SITE, designated SEQ ID:22534, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35364] Another function of VGAM940 is therefore inhibition of Zinc Finger Protein (C2H2 type) 277 (ZNF277, Accession NM_021994). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF277. FHX (Accession NM_018416) is another VGAM940 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:20456, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35365] Another function of VGAM940 is therefore inhibition of FHX (Accession NM_018416). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX. FLJ10035 (Accession NM_017974) is another VGAM940 host target gene. FLJ10035 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ10035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10035 BINDING SITE, designated SEQ ID:19705, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35366] Another function of VGAM940 is therefore inhibition of FLJ10035 (Accession NM_017974). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10035. FLJ10283 (Accession NM_018046) is another VGAM940 host target gene. FLJ10283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10283 BINDING SITE, designated SEQ ID:19794, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35367] Another function of VGAM940 is therefore inhibition of

FLJ10283 (Accession NM_018046). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10283. FLJ20127 (Accession NM_017678) is another VGAM940 host target gene. FLJ20127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20127 BINDING SITE, designated SEQ ID:19219, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35368] Another function of VGAM940 is therefore inhibition of FLJ20127 (Accession NM_017678). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20127. KIAA0828 (Accession XM_088105) is another VGAM940 host target gene. KIAA0828 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:39514, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35369] Another function of VGAM940 is therefore inhibition of KIAA0828 (Accession XM_088105). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828. KIAA1163 (Accession XM_086231) is another VGAM940 host target gene. KIAA1163 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1163 BINDING SITE, designated SEQ ID:38560, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35370] Another function of VGAM940 is therefore inhibition of KIAA1163 (Accession XM_086231). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1163. KIAA1434 (Accession XM_045585) is another

VGAM940 host target gene. KIAA1434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1434 BINDING SITE, designated SEQ ID:34487, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35371] Another function of VGAM940 is therefore inhibition of KIAA1434 (Accession XM_045585). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1434. KIAA1821 (Accession XM_050101) is another VGAM940 host target gene. KIAA1821 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1821 BINDING SITE, designated SEQ ID:35553, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35372] Another function of VGAM940 is therefore inhibition of KIAA1821 (Accession XM_050101). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1821. Macrophage Erythroblast Attacher (MAEA, Accession NM_005882) is another VGAM940 host target gene. MAEA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAEA BINDING SITE, designated SEQ ID:12494, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35373] Another function of VGAM940 is therefore inhibition of Macrophage Erythroblast Attacher (MAEA, Accession NM_005882). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAEA. Zinc Finger Protein 31 (KOX 29) (ZNF31, Accession XM_036305) is another VGAM940 host target gene. ZNF31 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF31, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF31 BINDING SITE, designated SEQ ID:32422, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35374] Another function of VGAM940 is therefore inhibition of Zinc Finger Protein 31 (KOX 29) (ZNF31, Accession XM_036305). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF31. LOC118709 (Accession XM_058338) is another VGAM940 host target gene. LOC118709 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC118709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118709 BINDING SITE, designated SEQ ID:36599, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35375] Another function of VGAM940 is therefore inhibition of LOC118709 (Accession XM_058338). Accordingly, utilities

of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118709. LOC158310 (Accession XM_098919) is another VGAM940 host target gene. LOC158310 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158310 BINDING SITE, designated SEQ ID:41946, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35376] Another function of VGAM940 is therefore inhibition of LOC158310 (Accession XM_098919). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310. LOC256519 (Accession XM_171056) is another VGAM940 host target gene. LOC256519 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256519 BINDING SITE, designated SEQ ID:45852, to the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, also designated SEQ ID:3651.

[35377] Another function of VGAM940 is therefore inhibition of LOC256519 (Accession XM_171056). Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256519. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 941 (VGAM941) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35378] VGAM941 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM941 was detected is described hereinabove with reference to Figs. 1–8.

[35379] VGAM941 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM941 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35380] VGAM941 gene encodes a VGAM941 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM941 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM941 precursor RNA is designated SEQ ID:927, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:927 is located at position 5149 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[35381] VGAM941 precursor RNA folds onto itself, forming VGAM941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35382] An enzyme complex designated DICER COMPLEX, `dices` the VGAM941 folded precursor RNA into VGAM941 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM941 RNA is designated SEQ ID:3652, and is provided hereinbelow with reference to the sequence listing part.

[35383] VGAM941 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM941 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM941 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35384] VGAM941 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM941 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM941 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM941 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM941 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35385] The complementary binding of VGAM941 RNA, herein designated VGAM RNA, to host target binding sites on VGAM941 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM941 host target RNA into VGAM941 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35386] It is appreciated that VGAM941 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM941 host target genes. The mRNA of each one of this plurality of VGAM941 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM941 RNA, herein designated VGAM RNA, and which when bound by VGAM941 RNA causes inhibition of translation of respective one or more VGAM941 host target proteins.

[35387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM941 gene, herein designated VGAM GENE, on one or more VGAM941 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[35388] It is yet further appreciated that a function of VGAM941 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM941 correlate with, and may be deduced from, the identity of the host target genes which VGAM941 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35389] Nucleotide sequences of the VGAM941 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM941 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM941 are further described hereinbelow with reference to Table 1.

[35390] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM941 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM941 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35391] As mentioned hereinabove with reference to Fig. 1, a function of VGAM941 gene, herein designated VGAM is inhibition of expression of VGAM941 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM941 correlate with, and may be deduced from, the identity of the target genes which VGAM941 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35392] Ataxia Telangiectasia Mutated (includes complementation groups A, C and D) (ATM, Accession NM_138292) is a VGAM941 host target gene. ATM BINDING SITE1 and ATM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATM BINDING SITE1 and ATM BINDING SITE2, designated SEQ ID:28704 and SEQ ID:28706 respectively, to the nucleotide sequence of VGAM941 RNA, herein designated

VGAM RNA, also designated SEQ ID:3652.

[35393] A function of VGAM941 is therefore inhibition of Ataxia Telangiectasia Mutated (includes complementation groups A, C and D) (ATM, Accession NM_138292). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATM. Fc Fragment of IgG, Low Affinity Ila, Receptor For (CD32) (FCGR2A, Accession XM_086483) is another VGAM941 host target gene. FCGR2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FCGR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCGR2A BINDING SITE, designated SEQ ID:38698, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35394] Another function of VGAM941 is therefore inhibition of Fc Fragment of IgG, Low Affinity Ila, Receptor For (CD32) (FCGR2A, Accession XM_086483), a gene which binds IgG immune complexes; member of the immunoglobulin superfamily. Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with FCGR2A. The function of FCGR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444.Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM_002293) is another VGAM941 host target gene. LAMC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMC1 BINDING SITE, designated SEQ ID:8074, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35395] Another function of VGAM941 is therefore inhibition of Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM_002293), a gene which may mediate the attachment, migration, and organization of cells into tissues. Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMC1. The function of LAMC1 and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM812. Myosin X (MYO10, Accession NM_012334) is another VGAM941 host target gene. MYO10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO10 BINDING SITE, designated SEQ ID:14731, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35396] Another function of VGAM941 is therefore inhibition of Myosin X (MYO10, Accession NM_012334), a gene which is an unconventional myosin. Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO10. The function of MYO10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. NADH Dehydrogenase (ubiquinone) Flavoprotein 3, 10kDa (NDUFV3, Accession NM_021075) is another VGAM941 host target gene. NDUFV3 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NDUFV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDUFV3 BINDING SITE, designated SEQ ID:22043, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35397] Another function of VGAM941 is therefore inhibition of NADH Dehydrogenase (ubiquinone) Flavoprotein 3, 10kDa (NDUFV3, Accession NM_021075), a gene which transports electrons from NADH to ubiquinone. Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFV3. The function of NDUFV3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM626. Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206) is another VGAM941 host target gene. PDGFRA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDGFRA, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ ID:12881, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35398] Another function of VGAM941 is therefore inhibition of Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206), a gene which this receptor binds platelet-derived growth factor and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRA. The function of PDGFRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM117. Solute Carrier Family 20 (phosphate transporter), Member 2 (SLC20A2, Accession NM_006749) is another VGAM941 host target gene. SLC20A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC20A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of SLC20A2 BINDING SITE, designated SEQ ID:13599, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35399] Another function of VGAM941 is therefore inhibition of Solute Carrier Family 20 (phosphate transporter), Member 2 (SLC20A2, Accession NM_006749), a gene which is a sodium-phosphate symporter. Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC20A2. The function of SLC20A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_000458) is another VGAM941 host target gene. TCF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF2 BINDING SITE, designated SEQ ID:6074, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA,

also designated SEQ ID:3652.

[35400] Another function of VGAM941 is therefore inhibition of Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_000458), a gene which probably binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF2. The function of TCF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118. Basic Leucine Zipper Nuclear Factor 1 (JEM-1) (BLZF1, Accession NM_003666) is another VGAM941 host target gene. BLZF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLZF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLZF1 BINDING SITE, designated SEQ ID:9747, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35401] Another function of VGAM941 is therefore inhibition of Basic Leucine Zipper Nuclear Factor 1 (JEM-1) (BLZF1, Ac-

cession NM_003666). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLZF1. Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384) is another VGAM941 host target gene. DGKD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKD BINDING SITE, designated SEQ ID:29877, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35402] Another function of VGAM941 is therefore inhibition of Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKD. FLJ21195 (Accession NM_022469) is another VGAM941 host target gene. FLJ21195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21195 BINDING SITE, designated SEQ ID:22824, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35403] Another function of VGAM941 is therefore inhibition of FLJ21195 (Accession NM_022469). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21195. KIAA0164 (Accession NM_014739) is another VGAM941 host target gene. KIAA0164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0164 BINDING SITE, designated SEQ ID:16404, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35404] Another function of VGAM941 is therefore inhibition of KIAA0164 (Accession NM_014739). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0164. KIAA0350 (Accession XM_028332) is another VGAM941 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30661, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35405] Another function of VGAM941 is therefore inhibition of KIAA0350 (Accession XM_028332). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA1396 (Accession XM_032054) is another VGAM941 host target gene. KIAA1396 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1396 BINDING SITE, designated SEQ ID:31546, to the nucleotide sequence of VGAM941 RNA, herein designated

VGAM RNA, also designated SEQ ID:3652.

[35406] Another function of VGAM941 is therefore inhibition of KIAA1396 (Accession XM_032054). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1396. KIAA1853 (Accession XM_045184) is another VGAM941 host target gene. KIAA1853 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE, designated SEQ ID:34382, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35407] Another function of VGAM941 is therefore inhibition of KIAA1853 (Accession XM_045184). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853. KIAA1884 (Accession XM_055539) is another VGAM941 host target gene. KIAA1884 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1884, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1884 BINDING SITE, designated SEQ ID:36291, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35408] Another function of VGAM941 is therefore inhibition of KIAA1884 (Accession XM_055539). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1884. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469) is another VGAM941 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:25526, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35409] Another function of VGAM941 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2

(SH3BGRL2, Accession NM_031469). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. LOC127255 (Accession NM_145258) is another VGAM941 host target gene. LOC127255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127255 BINDING SITE, designated SEQ ID:29773, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35410] Another function of VGAM941 is therefore inhibition of LOC127255 (Accession NM_145258). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127255. LOC158563 (Accession XM_088606) is another VGAM941 host target gene. LOC158563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC158563 BINDING SITE, designated SEQ ID:39868, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35411] Another function of VGAM941 is therefore inhibition of LOC158563 (Accession XM_088606). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158563. LOC163081 (Accession XM_091987) is another VGAM941 host target gene. LOC163081 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163081 BINDING SITE, designated SEQ ID:40085, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35412] Another function of VGAM941 is therefore inhibition of LOC163081 (Accession XM_091987). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163081. LOC51279 (Accession NM_016546) is an-

other VGAM941 host target gene. LOC51279 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51279 BINDING SITE, designated SEQ ID:18616, to the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, also designated SEQ ID:3652.

[35413] Another function of VGAM941 is therefore inhibition of LOC51279 (Accession NM_016546). Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51279. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 942 (VGAM942) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35414] VGAM942 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM942 was detected is described

hereinabove with reference to Figs. 1–8.

[35415] VGAM942 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM942 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35416] VGAM942 gene encodes a VGAM942 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM942 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM942 precursor RNA is designated SEQ ID:928, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:928 is located at position 3787 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[35417] VGAM942 precursor RNA folds onto itself, forming VGAM942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35418] An enzyme complex designated DICER COMPLEX, `dices` the VGAM942 folded precursor RNA into VGAM942 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM942 RNA is designated SEQ ID:3653, and is provided hereinbelow with reference to the sequence listing part.

[35419] VGAM942 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM942 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM942 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35420] VGAM942 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM942 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM942 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM942 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM942 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35421] The complementary binding of VGAM942 RNA, herein designated VGAM RNA, to host target binding sites on VGAM942 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM942 host target RNA into VGAM942 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35422] It is appreciated that VGAM942 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM942 host target genes. The mRNA of each one of this plurality of VGAM942 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM942 RNA, herein designated VGAM RNA, and which when bound by VGAM942 RNA causes inhibition of translation of respective one or more VGAM942 host target proteins.

[35423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM942 gene, herein designated VGAM GENE, on one or more VGAM942 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35424] It is yet further appreciated that a function of VGAM942 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM942 correlate with, and may be deduced from, the identity of the host target genes which VGAM942 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35425] Nucleotide sequences of the VGAM942 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM942 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM942 are further described hereinbelow with reference to Table 1.

[35426] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM942 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM942 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35427] As mentioned hereinabove with reference to Fig. 1, a function of VGAM942 gene, herein designated VGAM is inhibition of expression of VGAM942 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM942 correlate with, and may be deduced from, the identity of the target genes which VGAM942 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35428] EphB2 (EPHB2, Accession NM_004442) is a VGAM942 host target gene. EPHB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of EPHB2 BINDING SITE, designated SEQ ID:10732, to the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA, also designated SEQ ID:3653.

[35429] A function of VGAM942 is therefore inhibition of EphB2 (EPHB2, Accession NM_004442), a gene which Eph-related receptor tyrosine kinase B2; may have a role in neurogenesis. Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB2. The function of EPHB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM533. GATA Binding Protein 2 (GATA2, Accession NM_002050) is another VGAM942 host target gene. GATA2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GATA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:7804, to the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA,

also designated SEQ ID:3653.

[35430] Another function of VGAM942 is therefore inhibition of GATA Binding Protein 2 (GATA2, Accession NM_002050). Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2. GRAF (Accession NM_015071) is another VGAM942 host target gene. GRAF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRAF BINDING SITE, designated SEQ ID:17441, to the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA, also designated SEQ ID:3653.

[35431] Another function of VGAM942 is therefore inhibition of GRAF (Accession NM_015071), a gene which is a GTPase activating protein for p21-rac. Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRAF. The function of GRAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM430. Interleukin-1 Receptor-associated Kinase 1 (IRAK1, Accession NM_001569) is another VGAM942 host target gene. IRAK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRAK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRAK1 BINDING SITE, designated SEQ ID:7298, to the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA, also designated SEQ ID:3653.

[35432] Another function of VGAM942 is therefore inhibition of Interleukin-1 Receptor-associated Kinase 1 (IRAK1, Accession NM_001569). Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRAK1. KIAA0450 (Accession NM_014638) is another VGAM942 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated

SEQ ID:16027, to the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA, also designated SEQ ID:3653.

[35433] Another function of VGAM942 is therefore inhibition of KIAA0450 (Accession NM_014638). Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA0789 (Accession XM_033113) is another VGAM942 host target gene. KIAA0789 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0789 BINDING SITE, designated SEQ ID:31845, to the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA, also designated SEQ ID:3653.

[35434] Another function of VGAM942 is therefore inhibition of KIAA0789 (Accession XM_033113). Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0789. LIG-1 (Accession XM_033712) is another VGAM942 host target gene. LIG-1 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by LIG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIG-1 BINDING SITE, designated SEQ ID:31950, to the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA, also designated SEQ ID:3653.

[35435] Another function of VGAM942 is therefore inhibition of LIG-1 (Accession XM_033712). Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIG-1. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM_024607) is another VGAM942 host target gene. PPP1R3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE, designated SEQ ID:23855, to the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA, also designated SEQ ID:3653.

[35436] Another function of VGAM942 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM_024607). Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3B. STI2 (Accession XM_114335) is another VGAM942 host target gene. STI2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STI2 BINDING SITE, designated SEQ ID:42876, to the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA, also designated SEQ ID:3653.

[35437] Another function of VGAM942 is therefore inhibition of STI2 (Accession XM_114335). Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STI2. LOC51285 (Accession NM_016563) is another VGAM942 host target gene. LOC51285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51285, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51285 BINDING SITE, designated SEQ ID:18637, to the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA, also designated SEQ ID:3653.

[35438] Another function of VGAM942 is therefore inhibition of LOC51285 (Accession NM_016563). Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51285. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 943 (VGAM943) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35439] VGAM943 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM943 was detected is described hereinabove with reference to Figs. 1–8.

[35440] VGAM943 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and

Kidney Necrosis Virus. VGAM943 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35441] VGAM943 gene encodes a VGAM943 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM943 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM943 precursor RNA is designated SEQ ID:929, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:929 is located at position 6007 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[35442] VGAM943 precursor RNA folds onto itself, forming VGAM943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35443] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM943 folded precursor RNA into VGAM943 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM943 RNA is designated SEQ ID:3654, and is provided hereinbelow with reference to the sequence listing part.

[35444] VGAM943 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM943 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM943 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35445] VGAM943 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM943 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM943 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM943 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM943 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35446] The complementary binding of VGAM943 RNA, herein designated VGAM RNA, to host target binding sites on VGAM943 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM943 host target RNA into VGAM943 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35447] It is appreciated that VGAM943 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM943 host target genes. The mRNA of each one of this plurality of VGAM943 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM943 RNA, herein designated VGAM RNA, and which when bound by VGAM943 RNA causes inhibition of translation of respective one or more VGAM943 host target proteins.

[35448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM943 gene, herein designated VGAM GENE, on one or more VGAM943 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35449] It is yet further appreciated that a function of VGAM943 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM943 correlate with, and may be deduced from, the identity of the host target genes which VGAM943 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35450] Nucleotide sequences of the VGAM943 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM943 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM943 are further described hereinbelow with reference to Table 1.

- [35451] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM943 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM943 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [35452] As mentioned hereinabove with reference to Fig. 1, a function of VGAM943 gene, herein designated VGAM is inhibition of expression of VGAM943 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM943 correlate with, and may be deduced from, the identity of the target genes which VGAM943 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [35453] Adenomatosis Polyposis Coli (APC, Accession NM_000038) is a VGAM943 host target gene. APC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APC BINDING SITE, designated SEQ ID:5482, to the nucleotide sequence of

VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35454] A function of VGAM943 is therefore inhibition of Adenomatosis Polyposis Coli (APC, Accession NM_000038). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APC. Cadherin 17, LI Cadherin (liver-intestine) (CDH17, Accession NM_004063) is another VGAM943 host target gene. CDH17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH17 BINDING SITE, designated SEQ ID:10268, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35455] Another function of VGAM943 is therefore inhibition of Cadherin 17, LI Cadherin (liver-intestine) (CDH17, Accession NM_004063), a gene which may have a role in the morphological organization of liver and intestine and involved in intestinal peptide transport. Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CDH17. The function of CDH17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795. Diaphanous Homolog 2 (Drosophila) (DIAPH2, Accession NM_006729) is another VGAM943 host target gene. DIAPH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIAPH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIAPH2 BINDING SITE, designated SEQ ID:13558, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35456] Another function of VGAM943 is therefore inhibition of Diaphanous Homolog 2 (Drosophila) (DIAPH2, Accession NM_006729), a gene which may affect in oogenesis. Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIAPH2. The function of DIAPH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

in above with reference to VGAM129. Glucosaminyl (N-acetyl) Transferase 2, I-branching Enzyme (GCNT2, Accession NM_001491) is another VGAM943 host target gene. GCNT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GCNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCNT2 BINDING SITE, designated SEQ ID:7240, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35457] Another function of VGAM943 is therefore inhibition of Glucosaminyl (N-acetyl) Transferase 2, I-branching Enzyme (GCNT2, Accession NM_001491), a gene which converts linear into branched poly-N-acetyllactosaminoglycans. Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCNT2. The function of GCNT2 has been established by previous studies. The blood group i/I antigens were the first identified alloantigens that display a dramatic change during human development (OMIM Ref. No. 110800). The i and I

antigens are determined by linear and branched poly-N-acetyllactosaminoglycans, respectively. In human erythrocytes during embryonic development, the fetal (i) antigen is replaced by the adult (I) antigen as the result of the appearance of a beta-

1,6-N-acetylglucosaminyltransferase, the I-branching enzyme (GCNT2). Bierhuizen et al. (1993) cloned the cDNA for the branching enzyme that converts the linear form into the branched form and studied its expression with development of I antigen in transfected cells. The cDNA sequence predicted a protein of type II membrane topology as has been found for all other mammalian glycosyltransferases. Comparison of the amino acid sequence with those of other glycosyltransferases revealed that this I-branching enzyme and another beta-

1,6,N-acetylglucosaminyltransferase that forms a branch in O-glycans (GCNT1; 600391) are strongly homologous in the center of their putative catalytic domains.

[35458] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35459] Bierhuizen, M. F. A.; Mattei, M.-G.; Fukuda, M. : Expression of the developmental I antigen by a cloned human

cDNA encoding a member of a beta-1,6-N-acetylglucosaminyltransferase gene family. Genes Dev. 7: 468-478, 1993. ; and

[35460] Lin-Chu, M.; Broadberry, R. E.; Okubo, Y.; Tanaka, M. : The i phenotype and congenital cataracts among Chinese in Taiwan (Letter) Transfusion 31: 676-677, 1991.

[35461] Further studies establishing the function and utilities of GCNT2 are found in John Hopkins OMIM database record ID 600429, and in cited publications numbered 12154-12156, 4585, 758 and 12157-12158 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Histidine Ammonia-lyase (HAL, Accession NM_002108) is another VGAM943 host target gene. HAL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAL BINDING SITE, designated SEQ ID:7887, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35462] Another function of VGAM943 is therefore inhibition of Histidine Ammonia-lyase (HAL, Accession NM_002108).

Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAL. Sterol Carrier Protein 2 (SCP2, Accession NM_002979) is another VGAM943 host target gene. SCP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCP2 BINDING SITE, designated SEQ ID:8881, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35463] Another function of VGAM943 is therefore inhibition of Sterol Carrier Protein 2 (SCP2, Accession NM_002979), a gene which may regulate steroidogenesis. Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCP2. The function of SCP2 has been established by previous studies. During meiotic prophase, chromosomes are arranged along proteinaceous axes called axial elements. In rat, the major protein components of axial elements are proteins of 30, 33, and 190 kD. The 30- and 33-kD proteins are closely related and appear to be prod-

ucts of a single gene, Scp3 (synaptonemal complex protein-3; 604759). Offenberger et al. (1998) isolated rat testis cDNAs encoding the 190-kD protein, which they designated Scp2. Sequence analysis revealed that Scp2 is a basic protein, with a pI of 8. Scp2 contains 2 clusters of S/T-P motifs, which are common in DNA-binding proteins, and a C-terminal coiled-coil region. In Southwestern blot experiments, recombinant Scp2 bound DNA. Using immunocytochemistry, Offenberger et al. (1998) determined that Scp2 localizes specifically to the synaptonemal complex in the nuclei of rat testis meiotic prophase nuclei. Northern blot analysis indicated that Scp2 is expressed exclusively in testis. The authors noted that Scp2 shows some similarity at the amino acid sequence and secondary structural level to the *S. cerevisiae* Red1 protein, which is involved in meiotic recombination and the assembly of axial elements of synaptonemal complexes. They speculated that Scp2 is a DNA-binding protein involved in the structural organization of meiotic prophase chromosomes. By screening a human testis library with a partial rat Scp2 cDNA, Schalk et al. (1999) isolated cDNAs encoding human SCP2. The predicted 1,530-amino acid human protein shares 63% amino acid identity with rat Scp2. Like rat Scp2, human

SCP2 contains S/T-P motifs, 2 nuclear targeting signals, and a C-terminal coiled-coil region.

[35464] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35465] Offenberg, H. H.; Schalk, J. A. C.; Meuwissen, R. L. J.; van Aalderen, M.; Kester, H. A.; Dietrich, A. J. J.; Heyting, C. : SCP2: a major protein component of the axial elements of synaptonemal complexes of the rat. *Nucleic Acids Res.* 26: 2572-2579, 1998. ; and

[35467] Further studies establishing the function and utilities of SCP2 are found in John Hopkins OMIM database record ID 604105, and in cited publications numbered 7057-7058 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ10759 (Accession NM_018207) is another VGAM943 host target gene. FLJ10759 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10759, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10759 BINDING SITE, designated SEQ ID:20103, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35468] Another function of VGAM943 is therefore inhibition of FLJ10759 (Accession NM_018207). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10759. FLJ20151 (Accession NM_017689) is another VGAM943 host target gene. FLJ20151 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20151, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20151 BINDING SITE, designated SEQ ID:19246, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35469] Another function of VGAM943 is therefore inhibition of FLJ20151 (Accession NM_017689). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20151. FLJ21617 (Accession NM_030897) is another VGAM943 host target gene. FLJ21617 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21617 BINDING SITE, designated SEQ ID:25166, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35470] Another function of VGAM943 is therefore inhibition of FLJ21617 (Accession NM_030897). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21617. KIAA0673 (Accession XM_030915) is another VGAM943 host target gene. KIAA0673 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0673 BINDING SITE, designated SEQ ID:31214, to the nucleotide sequence of

VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35471] Another function of VGAM943 is therefore inhibition of KIAA0673 (Accession XM_030915). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0673. KLK15 (Accession NM_138563) is another VGAM943 host target gene. KLK15 BINDING SITE1 and KLK15 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLK15, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK15 BINDING SITE1 and KLK15 BINDING SITE2, designated SEQ ID:28861 and SEQ ID:23263 respectively, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35472] Another function of VGAM943 is therefore inhibition of KLK15 (Accession NM_138563). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK15. Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654)

is another VGAM943 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16084, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35473] Another function of VGAM943 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. Trans-golgi Network Protein 2 (TGOLN2, Accession XM_034215) is another VGAM943 host target gene. TGOLN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGOLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGOLN2 BINDING SITE, designated SEQ ID:32021, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3654.

[35474] Another function of VGAM943 is therefore inhibition of Trans-golgi Network Protein 2 (TGOLN2, Accession XM_034215). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGOLN2. LOC125268 (Accession XM_071960) is another VGAM943 host target gene. LOC125268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC125268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125268 BINDING SITE, designated SEQ ID:37453, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35475] Another function of VGAM943 is therefore inhibition of LOC125268 (Accession XM_071960). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125268. LOC144017 (Accession XM_096520) is another VGAM943 host target gene. LOC144017 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC144017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144017 BINDING SITE, designated SEQ ID:40388, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35476] Another function of VGAM943 is therefore inhibition of LOC144017 (Accession XM_096520). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144017. LOC148137 (Accession NM_144692) is another VGAM943 host target gene. LOC148137 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:29513, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35477] Another function of VGAM943 is therefore inhibition of LOC148137 (Accession NM_144692). Accordingly, utilities

of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137. LOC204970 (Accession XM_114795) is another VGAM943 host target gene. LOC204970 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204970 BINDING SITE, designated SEQ ID:43073, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35478] Another function of VGAM943 is therefore inhibition of LOC204970 (Accession XM_114795). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204970. LOC219654 (Accession XM_166095) is another VGAM943 host target gene. LOC219654 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC219654 BINDING SITE, designated SEQ ID:43878, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35479] Another function of VGAM943 is therefore inhibition of LOC219654 (Accession XM_166095). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654. LOC253539 (Accession XM_171134) is another VGAM943 host target gene. LOC253539 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253539 BINDING SITE, designated SEQ ID:45938, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35480] Another function of VGAM943 is therefore inhibition of LOC253539 (Accession XM_171134). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253539. LOC254559 (Accession XM_172931) is another VGAM943 host target gene. LOC254559 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254559 BINDING SITE, designated SEQ ID:46197, to the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, also designated SEQ ID:3654.

[35481] Another function of VGAM943 is therefore inhibition of LOC254559 (Accession XM_172931). Accordingly, utilities of VGAM943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254559. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 944 (VGAM944) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35482] VGAM944 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM944 was detected is described hereinabove with reference to Figs. 1-8.

[35483] VGAM944 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 7. VGAM944 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35484] VGAM944 gene encodes a VGAM944 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM944 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM944 precursor RNA is designated SEQ ID:930, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:930 is located at position 97457 relative to the genome of Human Herpesvirus 7.

[35485] VGAM944 precursor RNA folds onto itself, forming VGAM944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[35486] An enzyme complex designated DICER COMPLEX, `dices` the VGAM944 folded precursor RNA into VGAM944 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM944 RNA is designated SEQ ID:3655, and is provided hereinbelow with reference to the sequence listing part.

[35487] VGAM944 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM944 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM944 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35488] VGAM944 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM944 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM944 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM944 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM944 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35489] The complementary binding of VGAM944 RNA, herein designated VGAM RNA, to host target binding sites on VGAM944 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM944 host target RNA into VGAM944 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35490] It is appreciated that VGAM944 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM944 host target genes. The mRNA of each one of this plurality of VGAM944 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM944 RNA, herein designated VGAM RNA, and which when bound by VGAM944 RNA causes inhibition of translation of respective one or more VGAM944 host target proteins.

[35491] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM944 gene, herein designated VGAM GENE, on one or more VGAM944 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35492] It is yet further appreciated that a function of VGAM944 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM944 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM944 correlate with, and may be deduced from, the identity of the host target genes which VGAM944 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35493] Nucleotide sequences of the VGAM944 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM944 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM944 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM944 are further described hereinbelow with reference to Table 1.

[35494] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM944 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM944 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35495] As mentioned hereinabove with reference to Fig. 1, a function of VGAM944 gene, herein designated VGAM is inhibition of expression of VGAM944 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM944 correlate with, and may be deduced from, the identity of the target genes which VGAM944 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35496] PRO1386 (Accession NM_031269) is a VGAM944 host target gene. PRO1386 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of PRO1386 BINDING SITE, designated SEQ ID:25289, to the nucleotide sequence of VGAM944 RNA, herein designated VGAM RNA, also designated SEQ ID:3655.

[35497] A function of VGAM944 is therefore inhibition of PRO1386 (Accession NM_031269). Accordingly, utilities of VGAM944 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1386. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 945 (VGAM945) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35498] VGAM945 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM945 was detected is described hereinabove with reference to Figs. 1–8.

[35499] VGAM945 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 7. VGAM945 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35500] VGAM945 gene encodes a VGAM945 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM945 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM945 precursor RNA is designated SEQ ID:931, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:931 is located at position 98645 relative to the genome of Human Herpesvirus 7.

[35501] VGAM945 precursor RNA folds onto itself, forming VGAM945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35502] An enzyme complex designated DICER COMPLEX, `dices` the VGAM945 folded precursor RNA into VGAM945 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM945 RNA is designated SEQ ID:3656, and is provided hereinbelow with reference to the sequence listing part.

[35503] VGAM945 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM945 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM945 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35504] VGAM945 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM945 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM945 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM945 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM945 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[35505] The complementary binding of VGAM945 RNA, herein designated VGAM RNA, to host target binding sites on VGAM945 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM945 host target RNA into VGAM945 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35506] It is appreciated that VGAM945 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM945 host target genes. The mRNA of each one of this plurality of VGAM945 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM945 RNA, herein designated VGAM RNA, and which when bound by VGAM945 RNA causes inhibition of translation of respective one or more VGAM945 host target proteins.

[35507] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM945 gene, herein designated VGAM GENE, on one or more VGAM945 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[35508] It is yet further appreciated that a function of VGAM945 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM945 correlate with, and may be deduced from, the identity of the host target genes which VGAM945 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35509] Nucleotide sequences of the VGAM945 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM945 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM945 are further described hereinbelow with reference to Table 1.

[35510] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM945 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM945 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35511] As mentioned hereinabove with reference to Fig. 1, a function of VGAM945 gene, herein designated VGAM is inhibition of expression of VGAM945 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM945 correlate with, and may be deduced from, the identity of the target genes which VGAM945 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35512] Potassium Inwardly-rectifying Channel, Subfamily J, Member 1 (KCNJ1, Accession NM_000220) is a VGAM945 host target gene. KCNJ1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNJ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ1 BINDING SITE, designated SEQ ID:5727, to the nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, also designated SEQ ID:3656.

[35513] A function of VGAM945 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 1 (KCNJ1, Accession NM_000220). Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ1. Transcription Factor Dp-1 (TFDP1, Accession NM_007111) is another VGAM945 host target gene. TFDP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFDP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFDP1 BINDING SITE, designated SEQ ID:13977, to the nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, also designated SEQ ID:3656.

[35514] Another function of VGAM945 is therefore inhibition of Transcription Factor Dp-1 (TFDP1, Accession NM_007111). Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFDP1. Von Hippel-Lindau Binding Protein 1 (VBP1, Accession NM_003372) is another VGAM945 host target gene. VBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by VBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VBP1 BINDING SITE, designated SEQ ID:9400, to the nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, also designated SEQ ID:3656.

[35515] Another function of VGAM945 is therefore inhibition of Von Hippel–Lindau Binding Protein 1 (VBP1, Accession NM_003372), a gene which binds specifically to cytosolic chaperonin (c-cpn) and transfers target proteins to it. Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VBP1. The function of VBP1 has been established by previous studies. Brinke et al. (1996) reported the presence of a novel inversion in the factor VIII (OMIM Ref. No. 306700) gene in hemophilic monozygotic twins. Brinke et al. (1996) noted that this novel inversion creates 2 hybrid transcription units. One of these is formed by the promoter and first exon of factor VIII and novel sequences. Brinke et al. (1997) determined that these novel sequences were part of the VBP1 gene. The VBP1 gene contains 6 exons and spans at least 30 kb. Northern blot

analysis revealed that VBP1 is ubiquitously expressed as a 1.7-kb mRNA and a much weaker 5.0-kb mRNA. By primer extension analysis, Brinke et al. (1997) found that there are 2 major and 1 minor transcription start sites. Brinke et al. (1997) cloned cDNAs of the mouse VBP1 homolog. The 160-amino acid mouse and human VBP1 protein sequences were identical. Clifford et al. (1999) could demonstrate no mutation in VBP1 in 89 sporadic cases of renal cell carcinoma. Hemberger et al. (1999) used the murine Vbp1 cDNA to investigate the expression of the Vbp1 mRNA in the mouse by in situ hybridization and Northern blot analysis. In fetal stages between days 9 and 18 of gestation, Vbp1 was expressed mainly in the central nervous system, retina, and liver. In addition, at day 12, high expression was observed in the labyrinthine region of the placenta. In later stage placentas, Vbp1 expression was, however, considerably reduced. Northern blot analysis of adult mouse tissues showed that Vbp1 was ubiquitously expressed. In situ analysis of several adult tissues showed that in most tissues the transcripts were evenly distributed. In brain, eye, kidney, and intestine, however, Vbp1 was expressed in specific cell types. In cerebellum and various tumors of VHL patients, no consistent differ-

ences in VBP1 expression levels could be detected between tumors characteristic of von Hippel–Lindau disease and normal tissue. Mapping of the murine Vbp1 gene revealed conserved chromosomal localization between mouse and human in a region homologous to human Xq28.

[35516] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35517] Brinke, A.; Tagliavacca, L.; Naylor, J.; Green, P.; Giangrande, P.; Giannelli, F. : Two chimaeric transcription units result from an inversion breaking intron 1 of the factor VIII gene and a region reportedly affected by reciprocal translocations in T–cell leukaemia. *Hum. Molec. Genet.* 5: 1945–1951, 1996. ; and

[35518] Hemberger, M.; Himmelbauer, H.; Neumann, H. P. H.; Plate, K. H.; Schwarzkopf, G.; Fundele, R. : Expression of the von Hippel–Lindau–binding protein–1 (Vbp1) in fetal and adult mouse tissue.

[35519] Further studies establishing the function and utilities of VBP1 are found in John Hopkins OMIM database record ID 300133, and in cited publications numbered 8945–8949 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. F-box Protein 30 (FBXO30, Accession NM_032145) is another VGAM945 host target gene. FBXO30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO30 BINDING SITE, designated SEQ ID:25839, to the nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, also designated SEQ ID:3656.

[35520] Another function of VGAM945 is therefore inhibition of F-box Protein 30 (FBXO30, Accession NM_032145). Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO30. FLJ23112 (Accession NM_024929) is another VGAM945 host target gene. FLJ23112 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23112 BINDING SITE, designated SEQ ID:24467, to the

nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, also designated SEQ ID:3656.

[35521] Another function of VGAM945 is therefore inhibition of FLJ23112 (Accession NM_024929). Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23112. MGC13114 (Accession NM_032366) is another VGAM945 host target gene. MGC13114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13114 BINDING SITE, designated SEQ ID:26154, to the nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, also designated SEQ ID:3656.

[35522] Another function of VGAM945 is therefore inhibition of MGC13114 (Accession NM_032366). Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13114. Sprouty Homolog 2 (Drosophila) (SPRY2, Accession NM_005842) is another VGAM945 host target gene. SPRY2 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by SPRY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPRY2 BINDING SITE, designated SEQ ID:12456, to the nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, also designated SEQ ID:3656.

[35523] Another function of VGAM945 is therefore inhibition of Sprouty Homolog 2 (Drosophila) (SPRY2, Accession NM_005842). Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY2. LOC144871 (Accession XM_096698) is another VGAM945 host target gene. LOC144871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144871 BINDING SITE, designated SEQ ID:40470, to the nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, also designated SEQ ID:3656.

[35524] Another function of VGAM945 is therefore inhibition of LOC144871 (Accession XM_096698). Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144871. LOC145988 (Accession XM_085290) is another VGAM945 host target gene. LOC145988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:38040, to the nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, also designated SEQ ID:3656.

[35525] Another function of VGAM945 is therefore inhibition of LOC145988 (Accession XM_085290). Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988. LOC219940 (Accession XM_167791) is another VGAM945 host target gene. LOC219940 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219940, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219940 BINDING SITE, designated SEQ ID:44834, to the nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, also designated SEQ ID:3656.

[35526] Another function of VGAM945 is therefore inhibition of LOC219940 (Accession XM_167791). Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219940. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 946 (VGAM946) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35527] VGAM946 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM946 was detected is described hereinabove with reference to Figs. 1–8.

[35528] VGAM946 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6. VGAM946 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[35529] VGAM946 gene encodes a VGAM946 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM946 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM946 precursor RNA is designated SEQ ID:932, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:932 is located at position 80004 relative to the genome of Human Herpesvirus 6.

[35530] VGAM946 precursor RNA folds onto itself, forming VGAM946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35531] An enzyme complex designated DICER COMPLEX, `dices` the VGAM946 folded precursor RNA into VGAM946 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM946 RNA is designated SEQ ID:3657, and is provided hereinbelow with reference to the sequence listing part.

[35532] VGAM946 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM946 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM946 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35533] VGAM946 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM946 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM946 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM946 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM946 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35534] The complementary binding of VGAM946 RNA, herein designated VGAM RNA, to host target binding sites on VGAM946 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM946 host target RNA into VGAM946 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[35535] It is appreciated that VGAM946 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM946 host target genes. The mRNA of each one of this plurality of VGAM946 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM946 RNA, herein designated VGAM RNA, and which when bound by VGAM946 RNA causes inhibition of translation of respective one or more VGAM946 host target proteins.

[35536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM946 gene, herein designated VGAM GENE, on one or more VGAM946 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35537] It is yet further appreciated that a function of VGAM946 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM946 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM946 correlate with, and may be deduced from, the identity of the host target genes which VGAM946 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35538] Nucleotide sequences of the VGAM946 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM946 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM946 are further described hereinbelow with reference to Table 1.

[35539] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM946 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM946 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35540] As mentioned hereinabove with reference to Fig. 1, a function of VGAM946 gene, herein designated VGAM is inhibition of expression of VGAM946 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM946 correlate with, and may be deduced from, the identity of the target genes which VGAM946 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35541] Cytoskeleton Associated Protein 2 (CKAP2, Accession NM_018204) is a VGAM946 host target gene. CKAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKAP2 BINDING SITE, designated SEQ ID:20088, to the nucleotide sequence of VGAM946 RNA, herein designated

VGAM RNA, also designated SEQ ID:3657.

[35542] A function of VGAM946 is therefore inhibition of Cytoskeleton Associated Protein 2 (CKAP2, Accession NM_018204). Accordingly, utilities of VGAM946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKAP2. KIAA0427 (Accession NM_014772) is another VGAM946 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16574, to the nucleotide sequence of VGAM946 RNA, herein designated VGAM RNA, also designated SEQ ID:3657.

[35543] Another function of VGAM946 is therefore inhibition of KIAA0427 (Accession NM_014772). Accordingly, utilities of VGAM946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. MGC15705 (Accession NM_032757) is another VGAM946 host target gene. MGC15705 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MGC15705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15705 BINDING SITE, designated SEQ ID:26498, to the nucleotide sequence of VGAM946 RNA, herein designated VGAM RNA, also designated SEQ ID:3657.

[35544] Another function of VGAM946 is therefore inhibition of MGC15705 (Accession NM_032757). Accordingly, utilities of VGAM946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15705. Mitochondrial Ribosomal Protein L10 (MRPL10, Accession NM_145255) is another VGAM946 host target gene. MRPL10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL10 BINDING SITE, designated SEQ ID:29769, to the nucleotide sequence of VGAM946 RNA, herein designated VGAM RNA, also designated SEQ ID:3657.

[35545] Another function of VGAM946 is therefore inhibition of

Mitochondrial Ribosomal Protein L10 (MRPL10, Accession NM_145255). Accordingly, utilities of VGAM946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL10. LOC220021 (Accession XM_167814) is another VGAM946 host target gene. LOC220021 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220021 BINDING SITE, designated SEQ ID:44851, to the nucleotide sequence of VGAM946 RNA, herein designated VGAM RNA, also designated SEQ ID:3657.

[35546] Another function of VGAM946 is therefore inhibition of LOC220021 (Accession XM_167814). Accordingly, utilities of VGAM946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220021. LOC91012 (Accession XM_035503) is another VGAM946 host target gene. LOC91012 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91012, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91012 BINDING SITE, designated SEQ ID:32278, to the nucleotide sequence of VGAM946 RNA, herein designated VGAM RNA, also designated SEQ ID:3657.

[35547] Another function of VGAM946 is therefore inhibition of LOC91012 (Accession XM_035503). Accordingly, utilities of VGAM946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91012. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 947 (VGAM947) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35548] VGAM947 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM947 was detected is described hereinabove with reference to Figs. 1–8.

[35549] VGAM947 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6. VGAM947 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[35550] VGAM947 gene encodes a VGAM947 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM947 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM947 precursor RNA is designated SEQ ID:933, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:933 is located at position 76244 relative to the genome of Human Herpesvirus 6.

[35551] VGAM947 precursor RNA folds onto itself, forming VGAM947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35552] An enzyme complex designated DICER COMPLEX, `dices` the VGAM947 folded precursor RNA into VGAM947 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM947 RNA is designated SEQ ID:3658, and is provided hereinbelow with reference to the sequence listing part.

[35553] VGAM947 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM947 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM947 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35554] VGAM947 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM947 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM947 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM947 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM947 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35555] The complementary binding of VGAM947 RNA, herein designated VGAM RNA, to host target binding sites on VGAM947 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM947 host target RNA into VGAM947 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[35556] It is appreciated that VGAM947 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM947 host target genes. The mRNA of each one of this plurality of VGAM947 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM947 RNA, herein designated VGAM RNA, and which when bound by VGAM947 RNA causes inhibition of translation of respective one or more VGAM947 host target proteins.

[35557] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM947 gene, herein designated VGAM GENE, on one or more VGAM947 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35558] It is yet further appreciated that a function of VGAM947 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM947 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM947 correlate with, and may be deduced from, the identity of the host target genes which VGAM947 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35559] Nucleotide sequences of the VGAM947 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM947 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM947 are further described hereinbelow with reference to Table 1.

[35560] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM947 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM947 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35561] As mentioned hereinabove with reference to Fig. 1, a function of VGAM947 gene, herein designated VGAM is inhibition of expression of VGAM947 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM947 correlate with, and may be deduced from, the identity of the target genes which VGAM947 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35562] Procollagen (type III) N-endopeptidase (PCOLN3, Accession NM_002768) is a VGAM947 host target gene. PCOLN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCOLN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCOLN3 BINDING SITE, designated SEQ ID:8661, to the nucleotide sequence of VGAM947 RNA,

herein designated VGAM RNA, also designated SEQ ID:3658.

[35563] A function of VGAM947 is therefore inhibition of Procollagen (type III) N-endopeptidase (PCOLN3, Accession NM_002768), a gene which is a member of the zincin superfamily of zinc-dependent metalloproteases. Accordingly, utilities of VGAM947 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCOLN3. The function of PCOLN3 has been established by previous studies. Metallopeptidases are a functionally diverse group of enzymes that are involved in critical stages of many biologic processes including bacterial pathogenesis, growth factor activation, and cancer metastasis. They are essential for the synthesis of the collagen that forms the fibrous scaffold of the extracellular matrix of tissues. Most metallopeptidases contain a zinc cation necessary for both structure coordination of the active site and catalysis. The zincin superfamily comprises metallopeptidases that contain the HEXXH zinc-binding consensus sequence. The 2 histidine residues serve as zinc ligands, and the glutamic acid residue polarizes a water molecule involved in the nucleophilic attack of peptide bonds. Subclassification is based on the identity of

other amino acids that act as zinc ligands. Gluzincins, for example, have glutamic acid as a third zinc ligand. Halila et al. (1989) isolated a possible cDNA for type III procollagen N-proteinase (OMIM Ref. No. PCOLN3) from a human placenta cDNA library. By screening a human placenta cDNA library with polyclonal antibodies raised against human PCOLN3 and the use of 5-prime RACE and primer extension strategies on the isolated cDNAs, Scott et al. (1996) identified a gene, which they symbolized PRSM1, that is a member of the gluzincin subfamily of metalloproteinases. The full-length composite sequence of the PRSM1 gene encodes a deduced 318-amino acid protein with an HELGH pentapeptide fitting the consensus sequence characteristic of zincins, and a glutamic acid 25 residues C-terminal of the first histidine, fitting the pattern of gluzincins for a third zinc-binding ligand. PRSM1 contains 3 clusters of cysteine residues: 1 cluster of 4 residues and 1 cluster of 6 residues at the N terminus and a cluster of 6 residues at the C terminus. However, the predicted sequence lacks potential glycosylation sites. Immunoblot analysis of placental tissue revealed an approximately 30-kD protein. Northern blot analysis of human fibroblast culture mRNA detected a transcript of approxi-

mately 2.5 kb. By Northern blot analysis, Nomura et al. (1994) found that PRSM1, which they designated KIAA0047, is expressed ubiquitously, with highest levels in lung and kidney as well as in HeLa and KG-1 cell lines.

[35564] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35565] Scott, I. C.; Halila, R.; Jenkins, J. M.; Mehan, S.; Apostolou, S.; Winqvist, R.; Callen, D. F.; Prockop, D. J.; Peltonen, L.; Kadler, K. E. : Molecular cloning, expression and chromosomal localization of a human gene encoding a 33 kDa putative metallopeptidase (PRSM1). *Gene* 174: 135-143, 1996. ; and

[35567] Further studies establishing the function and utilities of PCOLN3 are found in John Hopkins OMIM database record ID 164010, and in cited publications numbered 2253-225 and 12737 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fig. 1 further provides a conceptual description of a novel bioin-

formatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 948 (VGAM948) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35568] VGAM948 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM948 was detected is described hereinabove with reference to Figs. 1–8.

[35569] VGAM948 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Carnation Italian Ringspot Virus. VGAM948 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35570] VGAM948 gene encodes a VGAM948 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM948 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM948 precursor RNA is designated SEQ ID:934, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:934 is located at position 1710 relative to the genome of Carna–

tion Italian Ringspot Virus.

[35571] VGAM948 precursor RNA folds onto itself, forming VGAM948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35572] An enzyme complex designated DICER COMPLEX, `dices` the VGAM948 folded precursor RNA into VGAM948 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM948 RNA is designated SEQ ID:3659, and is provided hereinbelow with reference to the sequence listing part.

[35573] VGAM948 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM948 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM948 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35574] VGAM948 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM948 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM948 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM948 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM948 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[35575] The complementary binding of VGAM948 RNA, herein designated VGAM RNA, to host target binding sites on VGAM948 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM948 host target RNA into VGAM948 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35576] It is appreciated that VGAM948 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM948 host target genes. The mRNA of each one of this plurality of VGAM948 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM948 RNA, herein designated VGAM RNA, and which when bound by VGAM948 RNA causes inhibition of translation of respective one or more VGAM948 host target proteins.

[35577] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM948 gene, herein designated VGAM GENE, on one or more VGAM948 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35578] It is yet further appreciated that a function of VGAM948 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM948 include diagnosis, prevention and treatment of viral infection by Carnation Italian Ringspot Virus. Specific functions, and accordingly utilities, of

VGAM948 correlate with, and may be deduced from, the identity of the host target genes which VGAM948 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35579] Nucleotide sequences of the VGAM948 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM948 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM948 are further described hereinbelow with reference to Table 1.

[35580] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM948 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM948 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35581] As mentioned hereinabove with reference to Fig. 1, a function of VGAM948 gene, herein designated VGAM is inhibition of expression of VGAM948 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM948 correlate with, and may be deduced

from, the identity of the target genes which VGAM948 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35582] CD1A Antigen, A Polypeptide (CD1A, Accession XM_048792) is a VGAM948 host target gene. CD1A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CD1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD1A BINDING SITE, designated SEQ ID:35271, to the nucleotide sequence of VGAM948 RNA, herein designated VGAM RNA, also designated SEQ ID:3659.

[35583] A function of VGAM948 is therefore inhibition of CD1A Antigen, A Polypeptide (CD1A, Accession XM_048792), a gene which is involved in antigen presentation. Accordingly, utilities of VGAM948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD1A. The function of CD1A has been established by previous studies. Thymocyte antigens CD1 were thought to be human counterparts of mouse thymus leukemia (TL) antigens (OMIM Ref. No. 188850). Serological and biochemical analyses indicated the existence of at

least 3 subsets, the first of which was initially identified by a monoclonal antibody. Like TL antigens, CD1 antigens are expressed on cortical thymocytes, as well as on some lymphoid neoplasias, and resemble in structure the major histocompatibility complex class I antigens. (CD in the nomenclature of these cell surface antigens is derived from 'cluster of differentiation.')

The expression of surface markers correlates with the stage of differentiation of lymphocytes, hence they were referred to as differentiation markers and proved to be powerful tools for identification, characterization, and analysis. The concept of differentiation markers, although derived from studies on lymphocytes, has greater applicability. For example, the developing embryo has stage-specific markers, and many other developing systems can be studied by utilizing unique markers at certain stages of differentiation. Monoclonal antibodies facilitated greatly the identification of lymphocyte differentiation antigens; it also brought about a Tower of Babel in nomenclature as discoverers of new markers gave them new names without regard to possible identity to previously described antigens. In 1982, the First International Workshop in Human Leukocyte Differentiation Antigens was held in Paris. At that meeting, 139

monoclonal antibodies were tested by immunofluorescence, and the antibodies were grouped into 'clusters' on the basis of the results. At the Fifth International Congress of Immunology, held in Kyoto, Japan, in 1983, the nomenclature subcommittee officially adopted this scheme of nomenclature. The idea of the 'cluster of differentiation' was to group all known antibodies that reacted with the same marker. When new antigens are discovered, they are sometimes said to be 'clustered' when their relationship to other CDs has been determined. CD4 (OMIM Ref. No. 186940) and CD8 (OMIM Ref. No. 186910) are at the heart of many immunologic mechanisms. Park and Bendelac (2000) noted that the crystal structure of murine CD1D (see OMIM Ref. No. Zeng et al., 1997), showing a deep ligand-binding groove made of 2 large electrostatically neutral pockets lined with clustered hydrophobic residues, appears to suggest a way in which CD1 molecules, which complex with B2M (OMIM Ref. No. 109700), bind lipids. Park and Bendelac (2000) also observed that the stable lipid binding might occur in the secretory pathway, at the cell surface, or only after internalization in an acidified compartment. The intracellular locations include different compartments of the endocytic pathway: CD1A is concen-

trated in the early or recycling endosome, CD1B and CD1D in the late endosome or lysosome, and CD1C in the late endosome. Access to the endocytic pathway is regulated by a tyrosine-based motif in the cytoplasmic tail of CD1 that differs among CD1B, CD1C, and CD1D.

[35584] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35585] Park, S.-H.; Bendelac, A. : CD1-restricted T-cell responses and microbial infection. *Nature* 406: 788–792, 2000. ; and

[35587] Further studies establishing the function and utilities of CD1A are found in John Hopkins OMIM database record ID 188370, and in cited publications numbered 10280–10282, 10428–10430, 393 and 10279–5696 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Deleted In Lymphocytic Leukemia, 2 (DLEU2, Accession NM_006021) is another VGAM948 host target gene. DLEU2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by DLEU2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLEU2 BINDING SITE, designated SEQ ID:12638, to the nucleotide sequence of VGAM948 RNA, herein designated VGAM RNA, also designated SEQ ID:3659.

[35588] Another function of VGAM948 is therefore inhibition of Deleted In Lymphocytic Leukemia, 2 (DLEU2, Accession NM_006021). Accordingly, utilities of VGAM948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLEU2. Eukaryotic Translation Elongation Factor 1 Beta 2 (EEF1B2, Accession NM_001959) is another VGAM948 host target gene. EEF1B2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EEF1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EEF1B2 BINDING SITE, designated SEQ ID:7682, to the nucleotide sequence of VGAM948 RNA, herein designated VGAM RNA, also designated SEQ ID:3659.

[35589] Another function of VGAM948 is therefore inhibition of Eukaryotic Translation Elongation Factor 1 Beta 2 (EEF1B2, Accession NM_001959), a gene which stimulates the exchange of gdp bound to ef-1-alpha to gtp (by similarity). Accordingly, utilities of VGAM948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EEF1B2. The function of EEF1B2 has been established by previous studies. Sanders et al. (1991) identified a human cDNA by hybridization with a pig EF-1 beta probe. The gene was subsequently mapped by Pizzuti et al. (1993) to chromosome 2 by PCR analysis of a somatic cell hybrid DNA panel. The gene is referred to here as 'isoform 2a' of EEF1-beta because of its chromosome 2 location.

[35590] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35591] Pizzuti, A.; Gennarelli, M.; Novelli, G.; Colosimo, A.; Cicero, S. L.; Caskey, C. T.; Dallapiccola, B. : Human elongation factor EF-1-beta: cloning and characterization of the EF1-beta-5a gene and assignment of EF-1-beta isoforms to chromosomes 2, 5, 15 and X. Biochem. Biophys. Res. Commun. 197: 154-162, 1993. ; and

[35592] Sanders, J.; Maassen, J. A.; Amons, R.; Moller, W. : Nucleotide sequence of human elongation factor-1-beta cDNA. Nucleic Acids Res. 19: 4551, 1991.

[35593] Further studies establishing the function and utilities of EEF1B2 are found in John Hopkins OMIM database record ID 600655, and in cited publications numbered 87 and 7930 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate-ammonia Ligase (glutamine synthase) (GLUL, Accession NM_002065) is another VGAM948 host target gene. GLUL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLUL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLUL BINDING SITE, designated SEQ ID:7834, to the nucleotide sequence of VGAM948 RNA, herein designated VGAM RNA, also designated SEQ ID:3659.

[35594] Another function of VGAM948 is therefore inhibition of Glutamate-ammonia Ligase (glutamine synthase) (GLUL, Accession NM_002065), a gene which catalyzes the condensation of glutamate and ammonia to form glutamine.

Accordingly, utilities of VGAM948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLUL. The function of GLUL has been established by previous studies. Glutamine synthetase (EC 6.3.1.2), also called glutamate–ammonia ligase (GLUL), is expressed throughout the body and plays an important role in controlling body pH and in removing ammonia from the circulation. The enzyme clears L–glutamate, the major neurotransmitter in the central nervous system, from neuronal synapses (see OMIM Ref. No. references in Clancy et al., 1996). Gibbs et al. (1987) reported the complete 1,119–bp coding sequence of glutamine synthetase, which they determined from a liver–derived cDNA. Pesole et al. (1991) suggested that glutamine synthetase is a good molecular clock for determining times of divergence even as great as that which occurred between eukaryotes and prokaryotes. One conclusion reached by Pesole et al. (1991) was that organelle–specific enzymes, such as those of the mitochondria, may have originated from a duplication of nuclear genes. The endosymbiotic hypothesis suggests that a transfer of prokaryotic genes to nuclei occurred during the evolution of the primitive eukaryotic cell. In some cases, it is likely that the old prokaryotic

gene could not be active in the new nuclear genome environment and was totally lost because its function in the organelle could be dispensed with. Subsequently, a new organelle-specific enzyme could have originated to serve specialized metabolic functions. The presence of glutamine synthetase in mitochondria is linked to the nitrogen metabolism of the species, and in particular to the need for glutamine as a source of ammonia and for particular biochemical pathways for ammonia detoxification.

[35595] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35596] Gibbs, C. S.; Campbell, K. E.; Wilson, R. H. : Sequence of a human glutamine synthetase cDNA. *Nucleic Acids Res.* 15: 6293 only, 1987. ; and

[35597] Pesole, G.; Bozzetti, M. P.; Lanave, C.; Preparata, G.; Saccone, C. : Glutamine synthetase gene evolution: a good molecular clock. *Proc. Nat. Acad. Sci.* 88: 522–526, 1991.

[35598] Further studies establishing the function and utilities of GLUL are found in John Hopkins OMIM database record ID 138290, and in cited publications numbered 2012–2017 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC220753

(Accession XM_167549) is another VGAM948 host target gene. LOC220753 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220753 BINDING SITE, designated SEQ ID:44660, to the nucleotide sequence of VGAM948 RNA, herein designated VGAM RNA, also designated SEQ ID:3659.

[35599] Another function of VGAM948 is therefore inhibition of LOC220753 (Accession XM_167549). Accordingly, utilities of VGAM948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220753. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 949 (VGAM949) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35600] VGAM949 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM949 was detected is described hereinabove with reference to Figs. 1–8.

[35601] VGAM949 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Carnation Italian Ringspot Virus. VGAM949 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35602] VGAM949 gene encodes a VGAM949 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM949 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM949 precursor RNA is designated SEQ ID:935, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:935 is located at position 2039 relative to the genome of Carnation Italian Ringspot Virus.

[35603] VGAM949 precursor RNA folds onto itself, forming VGAM949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35604] An enzyme complex designated DICER COMPLEX, `dices` the VGAM949 folded precursor RNA into VGAM949 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM949 RNA is designated SEQ ID:3660, and is provided hereinbelow with reference to the sequence listing part.

[35605] VGAM949 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM949 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM949 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35606] VGAM949 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM949 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM949 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM949 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM949 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[35607] The complementary binding of VGAM949 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM949 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM949 host target RNA into VGAM949 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35608] It is appreciated that VGAM949 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM949 host target genes. The mRNA of each one of this plurality of VGAM949 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM949 RNA, herein designated VGAM RNA, and which when bound by VGAM949 RNA causes inhibition of translation of respective one or more VGAM949 host target proteins.

[35609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM949 gene, herein designated VGAM GENE, on one or more VGAM949 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35610] It is yet further appreciated that a function of VGAM949 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of viral infection by Carnation Italian Ringspot Virus. Specific functions, and accordingly utilities, of VGAM949 correlate with, and may be deduced from, the identity of the host target genes which VGAM949 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35611] Nucleotide sequences of the VGAM949 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM949 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM949 are further described hereinbelow with reference to Table 1.

[35612] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM949 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM949 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35613] As mentioned hereinabove with reference to Fig. 1, a function of VGAM949 gene, herein designated VGAM is inhibition of expression of VGAM949 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM949 correlate with, and may be deduced from, the identity of the target genes which VGAM949 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35614] APM1 (Accession NM_004797) is a VGAM949 host target gene. APM1 BINDING SITE1 and APM1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by APM1, corresponding to HOST TAR-

GET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE1 and APM1 BINDING SITE2, designated SEQ ID:11206 and SEQ ID:11212 respectively, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35615] A function of VGAM949 is therefore inhibition of APM1 (Accession NM_004797). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1. Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_033357) is another VGAM949 host target gene. CASP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CASP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE, designated SEQ ID:27205, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35616] Another function of VGAM949 is therefore inhibition of

Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_033357), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor-induced apoptosis. Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP8. The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM145. Coronin, Actin Binding Protein, 1C (CORO1C, Accession NM_014325) is another VGAM949 host target gene. CORO1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CORO1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORO1C BINDING SITE, designated SEQ ID:15628, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35617] Another function of VGAM949 is therefore inhibition of Coronin, Actin Binding Protein, 1C (CORO1C, Accession

NM_014325). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO1C. DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM_006892) is another VGAM949 host target gene. DNMT3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNMT3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3B BINDING SITE, designated SEQ ID:13759, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35618] Another function of VGAM949 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM_006892), a gene which is required for genome wide de novo methylation. Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3B. The function of DNMT3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM280. Eukaryotic Translation Initiation Factor 3, Subunit 10 Theta, 150/170kDa (EIF3S10, Accession XM_049795) is another VGAM949 host target gene. EIF3S10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF3S10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF3S10 BINDING SITE, designated SEQ ID:35502, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35619] Another function of VGAM949 is therefore inhibition of Eukaryotic Translation Initiation Factor 3, Subunit 10 Theta, 150/170kDa (EIF3S10, Accession XM_049795), a gene which binds to the 40s ribosome and promotes the binding of methionyl-trnai and mrna. Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF3S10. The function of EIF3S10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM882. FAT Tumor Suppressor Homolog 2

(Drosophila) (FAT2, Accession NM_001447) is another VGAM949 host target gene. FAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAT2 BINDING SITE, designated SEQ ID:7174, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35620] Another function of VGAM949 is therefore inhibition of FAT Tumor Suppressor Homolog 2 (Drosophila) (FAT2, Accession NM_001447), a gene which could function as a cell-adhesion protein. Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT2. The function of FAT2 has been established by previous studies. The domain that characterizes epidermal growth factor (EGF; 131530) consists of approximately 50 amino acids with 3 disulfide bonds. EGF-like domains are believed to play a critical role in a number of extracellular events, including cell adhesion and receptor-ligand interactions. Proteins with EGF-like domains often consist of more than 1,000

amino acids, have multiple copies of the EGF-like domain, and contain additional domains known to be involved in specific protein-protein interactions. To identify proteins containing EGF-like domains, Nakayama et al. (1998) searched a database of long cDNA sequences randomly selected from a human brain cDNA library for those that encode an EGF-like motif. They identified several partial cDNAs encoding novel proteins with EGF-like domains, such as FAT2, which they named MEGF1. Nakayama et al. (1998) isolated a rat cDNA containing the complete Megf1 coding sequence. The predicted Megf1 protein has a signal sequence, 34 cadherin motifs (see OMIM Ref. No. 603006), a laminin G domain (see OMIM Ref. No. 601033), 2 EGF-like domains, a transmembrane domain, a cytoplasmic proline-rich sequence, and a cytoplasmic RGD (arginine-glycine-aspartic acid) motif, which is found in proteins modulating cell adhesion. The predicted structure of Megf1 is similar overall to the structures of the Drosophila 'fat' gene product and human FAT (OMIM Ref. No. 600976), although the number of EGF-like domains varies among these proteins. The Drosophila fat gene is a tumor suppressor gene whose product controls cell proliferation and morphogenesis in the imaginal discs in a

contact-dependent manner. Northern blot analysis of various regions of rat brain detected Megf1 expression only in the cerebellum.

[35621] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35622] Nakayama, M.; Nakajima, D.; Nagase, T.; Nomura, N.; Seki, N.; Ohara, O. : Identification of high-molecular-weight proteins with multiple EGF-like motifs by motif-trap screening. *Genomics* 51: 27-34, 1998. ; and

[35623] Wu, Q.; Maniatis, T. : Large exons encoding multiple ectodomains are a characteristic feature of protocadherin genes. *Proc. Nat. Acad. Sci.* 97: 3124-3129, 2000.

[35624] Further studies establishing the function and utilities of FAT2 are found in John Hopkins OMIM database record ID 604269, and in cited publications numbered 7437-7438 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nucleosome Assembly Protein 1-like 4 (NAP1L4, Accession NM_005969) is another VGAM949 host target gene. NAP1L4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAP1L4, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAP1L4 BINDING SITE, designated SEQ ID:12589, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35625] Another function of VGAM949 is therefore inhibition of Nucleosome Assembly Protein 1-like 4 (NAP1L4, Accession NM_005969), a gene which may have a role as a histone chaperone. Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L4. The function of NAP1L4 has been established by previous studies. Hu et al. (1996) used a positional cloning approach to isolate a gene which is located 100 kb centromeric to the proximal Beckwith–Wiedemann breakpoint cluster region (BWS; 130650) on chromosome 11p15. This gene is homologous to the yeast nucleosome assembly protein NAP1 (OMIM Ref. No. 164060). The authors designated the new gene NAP2. They demonstrated that this gene shows biallelic expression in all tissues tested and that it therefore diverges in its expression from IGF2 (OMIM Ref. No. 147470), H19 (OMIM Ref. No. 103280), and p57(KIP2) (OMIM Ref. No. 600856), which also map to 11p15.5 in

the vicinity of the BWS gene. The NAP2 gene encodes a highly acidic protein of 375 amino acids. A 1,200-bp 3-prime untranslated region was present. Rodriguez et al. (1997) reported that the NAP1L4 gene consists of 14 exons and spans approximately 30.5 kb. Histones are thought to play a key role in regulating gene expression at the level of DNA packaging. The deduced amino acid sequence of NAP2 indicates that it is a protein with a potential nuclear localization motif and 2 clusters of highly acidic residues. By functional analysis of recombinant NAP2 protein purified from *Escherichia coli*, Rodriguez et al. (1997) found that this protein can interact with both core and linker histones (see OMIM Ref. No. 142709). They demonstrated that recombinant NAP2 can transfer histones onto naked DNA templates. Subcellular localization studies of NAP2 indicated that it can shuttle between the cytoplasm and nucleus, suggesting a role as a histone chaperone. NAP1L4 maps to a region implicated in Wilms tumor etiology (see OMIM Ref. No. 194071). Rodriguez et al. (1997) analyzed the gene encoding NAP2 for mutations and found no evidence of nonsense, frameshift, or deletion mutations. Their findings, coupled with tumor suppression assays in Wilms tumor cells, did not support a

role for NAP2 in the etiology of that neoplasm.

[35626] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35627] Hu, R.-J.; Lee, M. P.; Johnson, L. A.; Feinberg, A. P. : A novel human homologue of yeast nucleosome assembly protein, 65 kb centromeric to the p57(KIP2) gene, is biallelically expressed in fetal and adult tissues. Hum. Molec. Genet. 5: 1743–1748, 1996. ; and

[35628] Rodriguez, P.; Munroe, D.; Prawitt, D.; Chu, L. L.; Bric, E.; Kim, J.; Reid, L. H.; Davies, C.; Nakagama, H.; Loebbert, R.; Winterpacht, A.; Petruzzi, M.-J.; Higgins, M. J.; Nowak, N.;

[35629] Further studies establishing the function and utilities of NAP1L4 are found in John Hopkins OMIM database record ID 601651, and in cited publications numbered 6557–6558 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM_003768) is another VGAM949 host target gene. PEA15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PEA15 BINDING SITE, designated SEQ ID:9845, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35630] Another function of VGAM949 is therefore inhibition of Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM_003768), a gene which is a phosphoprotein and involved in glucose uptake. Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEA15. The function of PEA15 has been established by previous studies. Astrocytes are involved in a variety of functions, including storage of glycogen and support for the migration and differentiation of neurons. They express membrane receptors which allow them to respond to extracellular signals. Activation of the receptors induces a cascade of events, such as the stimulation of protein kinases and the subsequent phosphorylation of target proteins. Araujo et al. (1993) identified a unique 15-kD protein in astrocytes that exists as a nonphosphorylated form and as 2 increasingly phosphorylated varieties. This protein, which they called PEA15, contains a consensus site for protein

kinase C (PKC; e.g., 176960) and is an endogenous substrate for PKC. Using differential display to identify genes whose expressions are altered in tissues derived from type II diabetes mellitus (OMIM Ref. No. 125853) patients compared with nondiabetic individuals, Condorelli et al. (1998) cloned cDNAs encoding PEA15, which they named PED for 'phosphoprotein enriched in diabetes'. The ubiquitously expressed 2.8-kb PED mRNA was overexpressed in fibroblasts, skeletal muscle, and adipose tissue from type II diabetics. Levels of the 15-kD PED phosphoprotein were also elevated in type II diabetic tissues. The authors demonstrated that transfection of a PED cDNA into differentiating L6 skeletal muscle cells increases the content of glucose transporter-1 (GLUT1; 138140) on the plasma membrane and inhibits insulin-stimulated glucose transport and cell surface recruitment of glucose transporter-4 (GLUT4; 138190). These effects were reversed by blocking PKC activity.

[35631] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

for protein kinase C in astrocytes. J. Biol. Chem. 268: 5911–5920, 1993. ; and

[35633] Condorelli, G.; Vigliotta, G.; Iavarone, C.; Caruso, M.; Tocchi, C. G.; Andreozzi, F.; Cafieri, A.; Tecce, M. F.; Formisano, P.; Beguinot, L.; Beguinot, F. : PED/PEA-15 gene controls.

[35634] Further studies establishing the function and utilities of PEA15 are found in John Hopkins OMIM database record ID 603434, and in cited publications numbered 5348–5354 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Peanut-like 2 (Drosophila) (PNUTL2, Accession NM_080417) is another VGAM949 host target gene. PNUTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PNUTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNUTL2 BINDING SITE, designated SEQ ID:27836, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35635] Another function of VGAM949 is therefore inhibition of

Peanut-like 2 (Drosophila) (PNUTL2, Accession NM_080417), a gene which is involved in cytokinesis. Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNUTL2. The function of PNUTL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281) is another VGAM949 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:42832, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35636] Another function of VGAM949 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SCN1A. Sialyltransferase 4C (beta-galactoside alpha-2,3-sialyltransferase) (SIAT4C, Accession NM_006278) is another VGAM949 host target gene. SIAT4C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT4C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT4C BINDING SITE, designated SEQ ID:12957, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35637] Another function of VGAM949 is therefore inhibition of Sialyltransferase 4C (beta-galactoside alpha-2,3-sialyltransferase) (SIAT4C, Accession NM_006278), a gene which may be involved in the biosynthesis of the sialyl lewis x determinant. Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT4C. The function of SIAT4C has been established by previous studies. The synthesis of alpha-2,3-linked sialic acid to Gal(beta-1,3)GalNAc is mediated by at least 3 beta-galactoside alpha-2,3-sialyltransferases (EC 2.4.99.4),

SiaT-4, that are encoded by 3 distinct genes. In contrast, only a single gene encodes the beta-galactoside alpha-2,6-sialyltransferase (EC 2.4.99.1), SiaT-1. Chang et al. (1995) assessed the relationship and nature of the SiaT-4 genes. Analysis of human-mouse somatic cell hybrids demonstrated that the sialyltransferase genes are dispersed in the human genome. One gene, SiaT-4a, resides in chromosome 8; that for SiaT-4b resides in 1p34-p21; and that for SiaT-4c, in 11q23.3-qter. The gene symbols for these genes were designated SIAT4A (OMIM Ref. No. 607187), SIAT4B (OMIM Ref. No. 607188), and SIAT4C, respectively. Kitagawa et al. (1996) described the chromosomal mapping and genomic organization of the human alpha-2,3-sialyltransferase gene. They mapped the gene to 11q23-q24 by isotopic in situ hybridization to metaphase chromosomes. They showed that it spans more than 25 kb of human genomic DNA and is distributed over 14 exons that range in size from 61 to 679 bp. Previous characterization of cDNAs encoding this enzyme revealed that the gene produces at least 3 transcripts in human placenta, which code for identical protein sequences except at the 5-prime ends. Further screening for clones that contained the 5-prime end of

the cDNA identified 2 additional distinct mRNAs that are expressed in human placenta. Comparison of the genomic DNA sequence with that of the 5 different mRNAs indicated that these transcripts are produced by a combination of alternative splicing and alternative promoter utilization. Northern analysis indicated that one of them is specifically expressed in placenta, testis, and ovary, indicating that its expression is independently regulated from the others.

[35638] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35639] Chang, M.-L.; Eddy, R. L.; Shows, T. B.; Lau, J. T. Y. : Three genes that encode human beta-galactoside alpha-2,3-sialyltransferases. Structural analysis and chromosomal mapping studies. *Glycobiology* 5: 319-325, 1995. ; and

[35640] Kitagawa, H.; Mattei, M.-G.; Paulson, J. C. : Genomic organization and chromosomal mapping of the Gal-beta-1,3GalNAc/Gal-beta-1,4GlcNAc alpha-2,3-sialyltransferase. *J. Biol. Chem.* 271: 931.

[35641] Further studies establishing the function and utilities of SIAT4C are found in John Hopkins OMIM database record

ID 104240, and in cited publications numbered 475–47 and 474 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 26, Member 4 (SLC26A4, Accession NM_000441) is another VGAM949 host target gene. SLC26A4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC26A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A4 BINDING SITE, designated SEQ ID:6028, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35642] Another function of VGAM949 is therefore inhibition of Solute Carrier Family 26, Member 4 (SLC26A4, Accession NM_000441). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A4. CDK5 Regulatory Subunit Associated Protein 3 (CDK5RAP3, Accession NM_025197) is another VGAM949 host target gene. CDK5RAP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

CDK5RAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK5RAP3 BINDING SITE, designated SEQ ID:24852, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35643] Another function of VGAM949 is therefore inhibition of CDK5 Regulatory Subunit Associated Protein 3 (CDK5RAP3, Accession NM_025197). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK5RAP3. DIS3 (Accession NM_014953) is another VGAM949 host target gene. DIS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIS3 BINDING SITE, designated SEQ ID:17298, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35644] Another function of VGAM949 is therefore inhibition of

DIS3 (Accession NM_014953). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIS3.

FLJ11113 (Accession XM_002359) is another VGAM949 host target gene. FLJ11113 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11113 BINDING SITE, designated SEQ ID:29875, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35645] Another function of VGAM949 is therefore inhibition of FLJ11113 (Accession XM_002359). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11113. FLJ21324 (Accession XM_165988) is another VGAM949 host target gene. FLJ21324 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21324, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ21324 BINDING SITE, designated SEQ ID:43828, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35646] Another function of VGAM949 is therefore inhibition of FLJ21324 (Accession XM_165988). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21324. FLJ21918 (Accession NM_024939) is another VGAM949 host target gene. FLJ21918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21918 BINDING SITE, designated SEQ ID:24482, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35647] Another function of VGAM949 is therefore inhibition of FLJ21918 (Accession NM_024939). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21918. KIAA0254 (Accession NM_014758) is another VGAM949

host target gene. KIAA0254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0254 BINDING SITE, designated SEQ ID:16504, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35648] Another function of VGAM949 is therefore inhibition of KIAA0254 (Accession NM_014758). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0254. KIAA0258 (Accession NM_014785) is another VGAM949 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16641, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35649] Another function of VGAM949 is therefore inhibition of KIAA0258 (Accession NM_014785). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. KIAA0828 (Accession XM_088105) is another VGAM949 host target gene. KIAA0828 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:39513, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35650] Another function of VGAM949 is therefore inhibition of KIAA0828 (Accession XM_088105). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828. Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM_003010) is another VGAM949 host target gene. MAP2K4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP2K4, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K4 BINDING SITE, designated SEQ ID:8916, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35651] Another function of VGAM949 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM_003010). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K4. Trinucleotide Repeat Containing 6 (TNRC6, Accession XM_047123) is another VGAM949 host target gene. TNRC6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TNRC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNRC6 BINDING SITE, designated SEQ ID:34899, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35652] Another function of VGAM949 is therefore inhibition of

Trinucleotide Repeat Containing 6 (TNRC6, Accession XM_047123). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC6. TU12B1-TY (Accession NM_016575) is another VGAM949 host target gene. TU12B1-TY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TU12B1-TY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE, designated SEQ ID:18642, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35653] Another function of VGAM949 is therefore inhibition of TU12B1-TY (Accession NM_016575). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU12B1-TY. LOC115297 (Accession XM_053313) is another VGAM949 host target gene. LOC115297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115297, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115297 BINDING SITE, designated SEQ ID:36068, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35654] Another function of VGAM949 is therefore inhibition of LOC115297 (Accession XM_053313). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115297. LOC147165 (Accession XM_097205) is another VGAM949 host target gene. LOC147165 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147165 BINDING SITE, designated SEQ ID:40812, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35655] Another function of VGAM949 is therefore inhibition of LOC147165 (Accession XM_097205). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147165. LOC150605 (Accession XM_097927) is another VGAM949 host target gene. LOC150605 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150605, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150605 BINDING SITE, designated SEQ ID:41230, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35656] Another function of VGAM949 is therefore inhibition of LOC150605 (Accession XM_097927). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150605. LOC169436 (Accession XM_095696) is another VGAM949 host target gene. LOC169436 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169436 BINDING SITE, designated SEQ ID:40278, to the nucleotide sequence of VGAM949 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3660.

[35657] Another function of VGAM949 is therefore inhibition of LOC169436 (Accession XM_095696). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169436. LOC170425 (Accession XM_084330) is another VGAM949 host target gene. LOC170425 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170425 BINDING SITE, designated SEQ ID:37550, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35658] Another function of VGAM949 is therefore inhibition of LOC170425 (Accession XM_084330). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170425. LOC220729 (Accession XM_049575) is another VGAM949 host target gene. LOC220729 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220729, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220729 BINDING SITE, designated SEQ ID:35449, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35659] Another function of VGAM949 is therefore inhibition of LOC220729 (Accession XM_049575). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220729. LOC255031 (Accession XM_173187) is another VGAM949 host target gene. LOC255031 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255031 BINDING SITE, designated SEQ ID:46431, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35660] Another function of VGAM949 is therefore inhibition of LOC255031 (Accession XM_173187). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC255031. LOC257422 (Accession XM_172923) is another VGAM949 host target gene. LOC257422 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257422 BINDING SITE, designated SEQ ID:46191, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35661] Another function of VGAM949 is therefore inhibition of LOC257422 (Accession XM_172923). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257422. LOC91272 (Accession XM_037317) is another VGAM949 host target gene. LOC91272 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91272 BINDING SITE, designated SEQ ID:32613, to the

nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35662] Another function of VGAM949 is therefore inhibition of LOC91272 (Accession XM_037317). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91272. LOC93512 (Accession XM_051758) is another VGAM949 host target gene. LOC93512 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93512 BINDING SITE, designated SEQ ID:35876, to the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, also designated SEQ ID:3660.

[35663] Another function of VGAM949 is therefore inhibition of LOC93512 (Accession XM_051758). Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93512. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 950 (VGAM950) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35664] VGAM950 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM950 was detected is described hereinabove with reference to Figs. 1–8.

[35665] VGAM950 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Bushy Stunt Virus. VGAM950 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35666] VGAM950 gene encodes a VGAM950 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM950 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM950 precursor RNA is designated SEQ ID:936, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:936 is located at position 3278 relative to the genome of Tomato Bushy Stunt Virus.

[35667] VGAM950 precursor RNA folds onto itself, forming VGAM950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35668] An enzyme complex designated DICER COMPLEX, `dices` the VGAM950 folded precursor RNA into VGAM950 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM950 RNA is designated SEQ ID:3661, and is provided hereinbelow with reference to the sequence listing part.

[35669] VGAM950 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM950 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM950 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35670] VGAM950 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM950 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM950 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM950 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM950 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35671] The complementary binding of VGAM950 RNA, herein designated VGAM RNA, to host target binding sites on VGAM950 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM950 host target RNA into VGAM950 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35672] It is appreciated that VGAM950 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM950 host target genes. The mRNA of each one of this plurality of VGAM950 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM950 RNA, herein designated VGAM RNA, and which when bound by VGAM950 RNA causes inhibition of translation of respective one or more VGAM950 host target proteins.

[35673] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM950 gene, herein designated VGAM GENE, on one or more VGAM950 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35674] It is yet further appreciated that a function of VGAM950 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM950 include diagnosis, prevention and treatment of viral infection by Tomato Bushy Stunt Virus. Specific functions, and accordingly utilities, of VGAM950 correlate with, and may be deduced from, the identity of

the host target genes which VGAM950 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35675] Nucleotide sequences of the VGAM950 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM950 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM950 are further described hereinbelow with reference to Table 1.

[35676] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM950 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM950 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35677] As mentioned hereinabove with reference to Fig. 1, a function of VGAM950 gene, herein designated VGAM is inhibition of expression of VGAM950 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM950 correlate with, and may be deduced from, the identity of the target genes which VGAM950

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35678] RIG (Accession NM_006394) is a VGAM950 host target gene. RIG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIG BINDING SITE, designated SEQ ID:13106, to the nucleotide sequence of VGAM950 RNA, herein designated VGAM RNA, also designated SEQ ID:3661.

[35679] A function of VGAM950 is therefore inhibition of RIG (Accession NM_006394), a gene which is ribosomal protein S15. Accordingly, utilities of VGAM950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIG. The function of RIG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130) is another VGAM950 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLPH3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH3 BINDING SITE, designated SEQ ID:22684, to the nucleotide sequence of VGAM950 RNA, herein designated VGAM RNA, also designated SEQ ID:3661.

[35680] Another function of VGAM950 is therefore inhibition of Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130). Accordingly, utilities of VGAM950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 951 (VGAM951) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35681] VGAM951 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM951 was detected is described hereinabove with reference to Figs. 1–8.

[35682] VGAM951 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Bushy Stunt Virus. VGAM951 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35683] VGAM951 gene encodes a VGAM951 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM951 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM951 precursor RNA is designated SEQ ID:937, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:937 is located at position 1675 relative to the genome of Tomato Bushy Stunt Virus.

[35684] VGAM951 precursor RNA folds onto itself, forming VGAM951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35685] An enzyme complex designated DICER COMPLEX, `dices` the VGAM951 folded precursor RNA into VGAM951 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM951 RNA is designated SEQ ID:3662, and is provided hereinbelow with reference to the sequence listing part.

[35686] VGAM951 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM951 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM951 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[35687] VGAM951 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM951 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM951 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM951 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM951 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35688] The complementary binding of VGAM951 RNA, herein designated VGAM RNA, to host target binding sites on VGAM951 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM951 host target RNA into VGAM951 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35689] It is appreciated that VGAM951 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM951 host target genes. The mRNA of each one of this plurality of VGAM951 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM951 RNA, herein designated VGAM RNA, and which when bound by VGAM951 RNA causes inhibition of translation of respective one or more VGAM951 host target proteins.

[35690] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM951 gene, herein designated VGAM GENE, on one or more VGAM951 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35691] It is yet further appreciated that a function of VGAM951 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM951 include diagnosis, prevention and treatment of viral infection by Tomato Bushy Stunt Virus. Specific functions, and accordingly utilities, of VGAM951 correlate with, and may be deduced from, the identity of the host target genes which VGAM951 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35692] Nucleotide sequences of the VGAM951 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM951 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM951 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM951 are further
described hereinbelow with reference to Table 1.

[35693] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM951 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM951 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[35694] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM951 gene, herein designated VGAM is
inhibition of expression of VGAM951 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM951 correlate with, and may be deduced
from, the identity of the target genes which VGAM951
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[35695] Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession
NM_000134) is a VGAM951 host target gene. FABP2 BIND-

ING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FABP2 BINDING SITE, designated SEQ ID:5623, to the nucleotide sequence of VGAM951 RNA, herein designated VGAM RNA, also designated SEQ ID:3662.

[35696] A function of VGAM951 is therefore inhibition of Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM_000134), a gene which may have a role in dietary fat uptake or processing. Accordingly, utilities of VGAM951 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FABP2. The function of FABP2 has been established by previous studies. To test the hypothesis that the A54T FABP2 polymorphism is associated with impaired lipid metabolism and cardiovascular disease, Carlsson et al. (2000) compared clinical characteristics and a parental history of cardiovascular disease between 213 sib pairs discordant for the polymorphism. Sibs with an excess of the thr54 allele had higher triglyceride and cholesterol concentrations than sibs with the ala54 allele. Parents of offspring with the

thr/thr and thr/ala genotypes reported an increased prevalence of stroke compared to parents of offspring with the ala/ala genotype. The authors confirmed the association of the FABP2 thr54 allele with increased concentrations of cholesterol and triglycerides in genotype-discordant sib pairs. They also presented novel evidence that genetic variation in the FABP2 gene may increase susceptibility to stroke. To assess whether increased intestinal triglyceride input leads to elevated fasting and postprandial triglycerides in type 2 diabetes (NIDDM), Georgopoulos et al. (2000) studied the ala54-to-thr polymorphism of FABP2, which is associated with increased intestinal input of triglyceride. Of the 287 diabetic patients screened, 108 (37.6%) were heterozygous and 31 (10.8%) were homozygous for the thr54 allele. Mean fasting plasma triglyceride levels in patients with the wild-type (OMIM Ref. No. n = 80), those heterozygous for the thr54 allele (OMIM Ref. No. n = 57), and those homozygous for it (OMIM Ref. No. n = 18) were 2.0 ± 0.09 , 2.7 ± 0.20 , and 3.8 ± 0.43 mmol/L, respectively. A linear relationship of mean fasting plasma triglyceride levels between the 3 groups was found. After fat ingestion, the postprandial area under the curve of plasma triglyceride and chy-

lomicrons was higher in the thr54/thr54 (n = 6) than in the wild-type (n = 9). The authors concluded that their results support the hypothesis that, in type 2 diabetes, increased intestinal input of triglyceride can lead to elevated fasting and postprandial plasma triglycerides. triglyceride.

[35697] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35698] Carlsson, M.; Orho-Melander, M.; Hedenbro, J.; Almgren, P.; Groop, L. C. : The T54 allele of the intestinal fatty acid-binding protein 2 is associated with a parental history of stroke. J. Clin. Endocr. Metab. 85: 2801–2804, 2000. ; and

[35699] Georgopoulos, A.; Aras, O.; Tsai, M. Y. : Codon-54 polymorphism of the fatty acid-binding protein 2 gene is associated with elevation of fasting and postprandial triglyceride in type 2.

[35700] Further studies establishing the function and utilities of FABP2 are found in John Hopkins OMIM database record ID 134640, and in cited publications numbered 617–627 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC114971

(Accession XM_054936) is another VGAM951 host target gene. LOC114971 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by LOC114971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114971 BINDING SITE, designated SEQ ID:36208, to the nucleotide sequence of VGAM951 RNA, herein designated VGAM RNA, also designated SEQ ID:3662.

[35701] Another function of VGAM951 is therefore inhibition of LOC114971 (Accession XM_054936). Accordingly, utilities of VGAM951 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114971. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 952 (VGAM952) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35702] VGAM952 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM952 was detected is described hereinabove with reference to Figs. 1-8.

[35703] VGAM952 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Bushy Stunt Virus. VGAM952 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35704] VGAM952 gene encodes a VGAM952 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM952 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM952 precursor RNA is designated SEQ ID:938, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:938 is located at position 3036 relative to the genome of Tomato Bushy Stunt Virus.

[35705] VGAM952 precursor RNA folds onto itself, forming VGAM952 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[35706] An enzyme complex designated DICER COMPLEX, `dices` the VGAM952 folded precursor RNA into VGAM952 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM952 RNA is designated SEQ ID:3663, and is provided hereinbelow with reference to the sequence listing part.

[35707] VGAM952 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM952 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM952 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35708] VGAM952 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM952 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM952 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM952 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM952 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35709] The complementary binding of VGAM952 RNA, herein designated VGAM RNA, to host target binding sites on VGAM952 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM952 host target RNA into VGAM952 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35710] It is appreciated that VGAM952 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM952 host target genes. The mRNA of each one of this plurality of VGAM952 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM952 RNA, herein designated VGAM RNA, and which when bound by VGAM952 RNA causes inhibition of translation of respective one or more VGAM952 host target proteins.

[35711] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM952 gene, herein designated VGAM GENE, on one or more VGAM952 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35712] It is yet further appreciated that a function of VGAM952 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of viral infection by Tomato Bushy Stunt Virus. Specific functions, and accordingly utilities, of VGAM952 correlate with, and may be deduced from, the identity of the host target genes which VGAM952 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35713] Nucleotide sequences of the VGAM952 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM952 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM952 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM952 are further described hereinbelow with reference to Table 1.

[35714] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM952 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM952 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35715] As mentioned hereinabove with reference to Fig. 1, a function of VGAM952 gene, herein designated VGAM is inhibition of expression of VGAM952 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM952 correlate with, and may be deduced from, the identity of the target genes which VGAM952 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35716] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 4 (B4GALT4, Accession NM_003778) is a VGAM952 host target gene. B4GALT4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT4 BINDING SITE, designated SEQ ID:9862, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35717] A function of VGAM952 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 4 (B4GALT4, Accession NM_003778). Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT4. Cyclin T2 (CCNT2, Accession NM_058241) is another VGAM952 host target gene. CCNT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNT2 BINDING SITE, designated SEQ ID:27771, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35718] Another function of VGAM952 is therefore inhibition of Cyclin T2 (CCNT2, Accession NM_058241), a gene which is a regulatory subunit of the cyclin-dependent kinase

pair (cdk9/cyclin t) complex. Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNT2. The function of CCNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM159. Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is another VGAM952 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14890, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35719] Another function of VGAM952 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499) is another VGAM952 host target gene. NEO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEO1 BINDING SITE, designated SEQ ID:8321, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35720] Another function of VGAM952 is therefore inhibition of Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499), a gene which regulates the transition of undifferentiated proliferating cells to their differentiated state. Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEO1. The function of NEO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM329. Peroxisome Proliferative Activated Receptor, Gamma, Coactivator 1 (PPARGC1, Accession NM_013261) is another VGAM952 host target gene. PPARGC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPARGC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPARGC1 BINDING SITE, designated SEQ ID:14934, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35721] Another function of VGAM952 is therefore inhibition of Peroxisome Proliferative Activated Receptor, Gamma, Coactivator 1 (PPARGC1, Accession NM_013261), a gene which may play a role in insulin sensitivity and thermogenesis. Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPARGC1. The function of PPARGC1 has been established by previous studies. Adaptive thermogenesis is an important component of energy homeostasis and a metabolic defense against obesity, which is characterized by a chronic imbalance between

energy intake and expenditure. Part of energy expenditure results from a leaking of protons across the mitochondrial inner membrane which leads to energy dissipation because of uncoupling of oxygen consumption to ATP synthesis. Three mitochondrial uncoupling proteins, UCP1 (OMIM Ref. No. 113730), UCP2 (OMIM Ref. No. 601693), and UCP3 (OMIM Ref. No. 602044), are candidates to explain the proton leak. The most compelling evidence for a direct role of uncoupling proteins in the proton leak comes from data on brown fat-specific UCP1. During cold exposure, energy dissipation is increased through brown adipose tissue (BAT) hypertrophy, biogenesis of mitochondria, and increased expression and activation of UCP1. Data pointed to peroxisome proliferator-activated receptor-gamma (PPARG; 601487) as a transcriptional regulator of uncoupling protein expression. PPAR-gamma is a nuclear receptor activated by fatty acids and eicosanoids which plays a major role in adipocyte differentiation. In brown fat cells, PPARG activates an enhancer of the UCP1 gene promoter. Puigserver et al. (1998) cloned a novel transcription coactivator of nuclear receptors, termed Pgc1, from a mouse brown fat cDNA library. Pgc1 mRNA expression was dramatically elevated upon

cold exposure of mice in both brown fat and skeletal muscle, key thermogenic tissues. Pgc1 greatly increased the transcriptional activity of Ppar-gamma (OMIM Ref. No. 601487) and thyroid hormone receptor (see OMIM Ref. No. 190120) on the uncoupling protein Ucp1 (OMIM Ref. No. 113730) promoter. Ectopic expression of Pgc1 in white adipose cells activated expression of Ucp1 and key mitochondrial enzymes of the respiratory chain, and increased the cellular content of mitochondrial DNA.

Puigserver et al. (1998) suggested that PGC1 plays a key role in linking nuclear receptors to the transcriptional program of adaptive thermogenesis. Animal model experiments lend further support to the function of PPARGC1. Herzig et al. (2001) demonstrated that mice carrying a targeted disruption of the cAMP response element-binding (CREB) protein gene (OMIM Ref. No. 123810), or overexpressing a dominant-negative CREB inhibitor, exhibit fasting hyperglycemia and reduced expression of gluconeogenic enzymes. CREB was found to induce expression of the gluconeogenic program through the nuclear receptor coactivator PGC1, which was demonstrated to be a direct target for CREB regulation in vivo. Overexpression of PGC1 in CREB-deficient mice restored glucose homeosta-

sis and rescued the expression of gluconeogenic genes. In transient assays, PGC1 potentiated glucocorticoid induction of the gene for PEPCK, the rate-limiting enzyme in gluconeogenesis. PGC1 promotes cooperativity between cAMP and glucocorticoid signaling pathways during hepatic gluconeogenesis. Fasting hyperglycemia is strongly correlated with type II diabetes (OMIM Ref. No. 125853), so Herzig et al. (2001) concluded that the activation of PGC1 by CREB in liver contributes importantly to the pathogenesis of this disease.

[35722] It is appreciated that the abovementioned animal model for PPARGC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[35723] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35724] Puigserver, P.; Wu, Z.; Park, C. W.; Graves, R.; Wright, M.; Spiegelman, B. M. : A cold-inducible coactivator of nuclear receptors linked to adaptive thermogenesis. Cell 92: 829–839, 1998. ; and

[35725] Herzig, S.; Long, F.; Jhala, U. S.; Hedrick, S.; Quinn, R.; Bauer, A.; Rudolph, D.; Schutz, G.; Yoon, C.; Puigserver, P.;

Spiegelman, B.; Montminy, M. : CREB regulates hepatic gluconeogenesis.

[35726] Further studies establishing the function and utilities of PPARGC1 are found in John Hopkins OMIM database record ID 604517, and in cited publications numbered 4789, 490 and 11857–6932 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 21 Open Reading Frame 100 (C21orf100, Accession NM_145033) is another VGAM952 host target gene. C21orf100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf100 BINDING SITE, designated SEQ ID:29650, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35727] Another function of VGAM952 is therefore inhibition of Chromosome 21 Open Reading Frame 100 (C21orf100, Accession NM_145033). Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf100. DK–

FZP434N178 (Accession XM_050278) is another VGAM952 host target gene. DKFZP434N178 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434N178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N178 BINDING SITE, designated SEQ ID:35600, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35728] Another function of VGAM952 is therefore inhibition of DKFZP434N178 (Accession XM_050278). Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N178. Down Syndrome Critical Region Gene 6 (DSCR6, Accession NM_018962) is another VGAM952 host target gene. DSCR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR6 BINDING SITE, designated SEQ ID:21031, to the nucleotide sequence of

VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35729] Another function of VGAM952 is therefore inhibition of Down Syndrome Critical Region Gene 6 (DSCR6, Accession NM_018962). Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR6. FACTP140 (Accession NM_007192) is another VGAM952 host target gene. FACTP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FACTP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACTP140 BINDING SITE, designated SEQ ID:14046, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35730] Another function of VGAM952 is therefore inhibition of FACTP140 (Accession NM_007192). Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACTP140. FLJ23360 (Accession NM_023076) is another VGAM952 host target gene. FLJ23360 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23360 BINDING SITE, designated SEQ ID:23338, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35731] Another function of VGAM952 is therefore inhibition of FLJ23360 (Accession NM_023076). Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23360. HSA250839 (Accession NM_018401) is another VGAM952 host target gene. HSA250839 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA250839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA250839 BINDING SITE, designated SEQ ID:20440, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35732] Another function of VGAM952 is therefore inhibition of

HSA250839 (Accession NM_018401). Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA250839. LOC143943 (Accession XM_096504) is another VGAM952 host target gene. LOC143943 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143943 BINDING SITE, designated SEQ ID:40385, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35733] Another function of VGAM952 is therefore inhibition of LOC143943 (Accession XM_096504). Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143943. LOC151610 (Accession XM_087245) is another VGAM952 host target gene. LOC151610 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC151610 BINDING SITE, designated SEQ ID:39139, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35734] Another function of VGAM952 is therefore inhibition of LOC151610 (Accession XM_087245). Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151610. LOC200609 (Accession XM_117256) is another VGAM952 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43339, to the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, also designated SEQ ID:3663.

[35735] Another function of VGAM952 is therefore inhibition of LOC200609 (Accession XM_117256). Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 953 (VGAM953) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35736] VGAM953 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM953 was detected is described hereinabove with reference to Figs. 1–8.

[35737] VGAM953 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Spotted Wilt Virus. VGAM953 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35738] VGAM953 gene encodes a VGAM953 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM953 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM953 precursor RNA is designated SEQ ID:939, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:939 is

located at position 3700 relative to the genome of Tomato Spotted Wilt Virus.

[35739] VGAM953 precursor RNA folds onto itself, forming VGAM953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35740] An enzyme complex designated DICER COMPLEX, `dices` the VGAM953 folded precursor RNA into VGAM953 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM953 RNA is designated SEQ ID:3664, and is provided hereinbelow with reference to the sequence listing part.

[35741] VGAM953 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM953 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM953 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[35742] VGAM953 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM953 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM953 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM953 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM953 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[35743] The complementary binding of VGAM953 RNA, herein designated VGAM RNA, to host target binding sites on VGAM953 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM953 host target RNA into VGAM953 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35744] It is appreciated that VGAM953 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM953 host target genes. The mRNA of each one of this plurality of VGAM953 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM953 RNA, herein designated VGAM RNA, and which when bound by VGAM953 RNA causes inhibition of translation of respective one or more VGAM953

host target proteins.

[35745] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM953 gene, herein designated VGAM GENE, on one or more VGAM953 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35746] It is yet further appreciated that a function of VGAM953 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of viral infection by Tomato Spotted Wilt Virus.

Specific functions, and accordingly utilities, of VGAM953 correlate with, and may be deduced from, the identity of the host target genes which VGAM953 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35747] Nucleotide sequences of the VGAM953 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM953 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM953 are further described hereinbelow with reference to Table 1.

[35748] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM953 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM953 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35749] As mentioned hereinabove with reference to Fig. 1, a function of VGAM953 gene, herein designated VGAM is inhibition of expression of VGAM953 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM953 correlate with, and may be deduced from, the identity of the target genes which VGAM953 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35750] EH-domain Containing 4 (EHD4, Accession NM_139265) is a VGAM953 host target gene. EHD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EHD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHD4 BINDING SITE, designated SEQ ID:29256, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35751] A function of VGAM953 is therefore inhibition of EH-domain Containing 4 (EHD4, Accession NM_139265). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD4. Exostoses (multiple)-like 2 (EXTL2, Accession NM_001439) is another VGAM953 host target gene. EXTL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EXTL2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL2 BINDING SITE, designated SEQ ID:7160, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35752] Another function of VGAM953 is therefore inhibition of Exostoses (multiple)-like 2 (EXTL2, Accession NM_001439), a gene which is homologous to the EXT and EXTL genes. Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL2. The function of EXTL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM743. Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275) is another VGAM953 host target gene. IL1F5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1F5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F5 BINDING SITE, designated SEQ ID:14603,

to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35753] Another function of VGAM953 is therefore inhibition of Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275), a gene which is a novel interleukin-1 receptor antagonist gene. Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F5. The function of IL1F5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM263.S100 Calcium Binding Protein A5 (S100A5, Accession NM_002962) is another VGAM953 host target gene. S100A5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by S100A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100A5 BINDING SITE, designated SEQ ID:8876, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35754] Another function of VGAM953 is therefore inhibition of

S100 Calcium Binding Protein A5 (S100A5, Accession NM_002962), a gene which interacts with target proteins to link extracellular stimuli and cellular responses; member of the S100 family of tissue-specific calcium-binding proteins. Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100A5. The function of S100A5 has been established by previous studies. The S100 proteins are small calcium-binding proteins which display different expression patterns in human tissues. Some S100 proteins are associated with tumor development and the metastatic behavior of tumors. Engelkamp et al. (1993) established the physical linkage of 6 S100 genes by pulsed field gel electrophoresis and DNA sequencing of 15 kb containing the full coding region of 4 different S100 genes: S100E (S100A3; 176992), CAPL (S100A4; 114210), S100D (OMIM Ref. No. S100A5), and calcyclin (S100A6; 114110). Engelkamp et al. (1993) stated that 'this is the tightest mammalian gene cluster discovered so far.' The cluster was assigned to 1q21 by in situ hybridization. Two other S100 genes were located within 450 kb: S100L (S100A2; 176993) and S100A (S100A1; 176940). Schafer et al. (1995) isolated a YAC

from 1q21 on which 9 different genes coding for S100 calcium-binding proteins could be localized. The clustered organization of S100 genes allowed introduction of a new logical nomenclature based on their physical arrangement on the chromosome, with S100A1 being closest to the telomere and S100A9 (OMIM Ref. No. 123886) being closest to the centromere. In this nomenclature, S100D became S100A5.

[35755] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35756] Engelkamp, D.; Schafer, B. W.; Mattei, M. G.; Erne, P.; Heizmann, C. W. : Six S100 genes are clustered on human chromosome 1q21: identification of two genes coding for the two previously unreported calcium-binding proteins S100D and S100E. Proc. Nat. Acad. Sci. 90: 6547–6551, 1993. ; and

[35757] Schafer, B. W.; Wicki, R.; Engelkamp, D.; Mattei, M.–G.; Heizmann, C. W. : Isolation of a YAC clone covering a cluster of nine S100 genes on human chromosome 1q21: rationale for a new no.

[35758] Further studies establishing the function and utilities of S100A5 are found in John Hopkins OMIM database record

ID 176991, and in cited publications numbered 12359 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 12 Open Reading Frame 2 (C12orf2, Accession XM_096040) is another VGAM953 host target gene. C12orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C12orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C12orf2 BINDING SITE, designated SEQ ID:40290, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35759] Another function of VGAM953 is therefore inhibition of Chromosome 12 Open Reading Frame 2 (C12orf2, Accession XM_096040). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C12orf2. Chromosome 20 Open Reading Frame 38 (C20orf38, Accession NM_018327) is another VGAM953 host target gene. C20orf38 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf38, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf38 BINDING SITE, designated SEQ ID:20323, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35760] Another function of VGAM953 is therefore inhibition of Chromosome 20 Open Reading Frame 38 (C20orf38, Accession NM_018327). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf38. C6orf5 (Accession NM_015524) is another VGAM953 host target gene. C6orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf5 BINDING SITE, designated SEQ ID:17779, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35761] Another function of VGAM953 is therefore inhibition of C6orf5 (Accession NM_015524). Accordingly, utilities of

VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf5. Cartilage Acidic Protein 1 (CRTAC1, Accession NM_018058) is another VGAM953 host target gene. CRTAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRTAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAC1 BINDING SITE, designated SEQ ID:19827, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35762] Another function of VGAM953 is therefore inhibition of Cartilage Acidic Protein 1 (CRTAC1, Accession NM_018058). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAC1. DKFZp547A023 (Accession XM_052065) is another VGAM953 host target gene. DKFZp547A023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547A023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547A023 BINDING SITE, designated SEQ ID:35940, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35763] Another function of VGAM953 is therefore inhibition of DKFZp547A023 (Accession XM_052065). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547A023. FLJ10314 (Accession NM_018055) is another VGAM953 host target gene. FLJ10314 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10314 BINDING SITE, designated SEQ ID:19815, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35764] Another function of VGAM953 is therefore inhibition of FLJ10314 (Accession NM_018055). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10314.

G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776) is another VGAM953 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:16604, SEQ ID:27686 and SEQ ID:27699 respectively, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35765] Another function of VGAM953 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. LIM and SH3 Protein 1 (LASP1, Accession NM_006148) is another VGAM953 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:12801, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35766] Another function of VGAM953 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM_006148). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. MGC30052 (Accession NM_144721) is another VGAM953 host target gene. MGC30052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC30052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC30052 BINDING SITE, designated SEQ ID:29543, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35767] Another function of VGAM953 is therefore inhibition of MGC30052 (Accession NM_144721). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC30052. LOC149386 (Accession XM_097631) is another VGAM953 host target gene. LOC149386 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149386 BINDING SITE, designated SEQ ID:40985, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35768] Another function of VGAM953 is therefore inhibition of LOC149386 (Accession XM_097631). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149386. LOC154789 (Accession XM_088043) is another VGAM953 host target gene. LOC154789 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154789 BINDING SITE, designated SEQ ID:39487, to the nucleotide sequence of VGAM953 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3664.

[35769] Another function of VGAM953 is therefore inhibition of LOC154789 (Accession XM_088043). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154789. LOC158563 (Accession XM_088606) is another VGAM953 host target gene. LOC158563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158563 BINDING SITE, designated SEQ ID:39866, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35770] Another function of VGAM953 is therefore inhibition of LOC158563 (Accession XM_088606). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158563. LOC255270 (Accession XM_170578) is another VGAM953 host target gene. LOC255270 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255270, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255270 BINDING SITE, designated SEQ ID:45389, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35771] Another function of VGAM953 is therefore inhibition of LOC255270 (Accession XM_170578). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255270. LOC51026 (Accession NM_016072) is another VGAM953 host target gene. LOC51026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51026 BINDING SITE, designated SEQ ID:18142, to the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, also designated SEQ ID:3664.

[35772] Another function of VGAM953 is therefore inhibition of LOC51026 (Accession NM_016072). Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC51026. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 954 (VGAM954) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35773] VGAM954 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM954 was detected is described hereinabove with reference to Figs. 1–8.

[35774] VGAM954 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Spotted Wilt Virus. VGAM954 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35775] VGAM954 gene encodes a VGAM954 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM954 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM954 precursor RNA is designated SEQ

ID:940, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:940 is located at position 4634 relative to the genome of Tomato Spotted Wilt Virus.

[35776] VGAM954 precursor RNA folds onto itself, forming VGAM954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35777] An enzyme complex designated DICER COMPLEX, `dices` the VGAM954 folded precursor RNA into VGAM954 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM954 RNA is designated SEQ ID:3665, and is provided hereinbelow with reference to the sequence

listing part.

[35778] VGAM954 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM954 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM954 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35779] VGAM954 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM954 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM954 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM954 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM954 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35780] The complementary binding of VGAM954 RNA, herein designated VGAM RNA, to host target binding sites on VGAM954 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM954 host target RNA into VGAM954 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35781] It is appreciated that VGAM954 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM954 host target genes. The mRNA of each one of this plurality of VGAM954 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM954 RNA, herein designated VGAM

RNA, and which when bound by VGAM954 RNA causes inhibition of translation of respective one or more VGAM954 host target proteins.

[35782] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM954 gene, herein designated VGAM GENE, on one or more VGAM954 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35783] It is yet further appreciated that a function of VGAM954 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM954 include diagnosis, prevention and treatment of viral infection by Tomato Spotted Wilt Virus. Specific functions, and accordingly utilities, of VGAM954 correlate with, and may be deduced from, the identity of the host target genes which VGAM954 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35784] Nucleotide sequences of the VGAM954 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM954 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM954 are further described hereinbelow with reference to Table 1.

[35785] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM954 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM954 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35786] As mentioned hereinabove with reference to Fig. 1, a function of VGAM954 gene, herein designated VGAM is

inhibition of expression of VGAM954 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM954 correlate with, and may be deduced from, the identity of the target genes which VGAM954 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35787] Glycine Amidinotransferase (L-arginine:glycine amidinotransferase) (GATM, Accession NM_001482) is a VGAM954 host target gene. GATM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GATM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATM BINDING SITE, designated SEQ ID:7225, to the nucleotide sequence of VGAM954 RNA, herein designated VGAM RNA, also designated SEQ ID:3665.

[35788] A function of VGAM954 is therefore inhibition of Glycine Amidinotransferase (L-arginine:glycine amidinotransferase) (GATM, Accession NM_001482), a gene which glycine amidinotransferase; component of the creatine biosynthetic pathway. Accordingly, utilities of VGAM954 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with GATM. The function of GATM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM24. Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM_001530) is another VGAM954 host target gene. HIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIF1A BINDING SITE, designated SEQ ID:7264, to the nucleotide sequence of VGAM954 RNA, herein designated VGAM RNA, also designated SEQ ID:3665.

[35789] Another function of VGAM954 is therefore inhibition of Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM_001530), a gene which is a basic helix-loop-helix transcription factor and mediates transcriptional responses to hypoxia and dioxin-signaling. Accordingly, utilities of VGAM954 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with HIF1A. The function of HIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229.AUT-like 1, Cysteine Endopeptidase (*S. cerevisiae*) (AUTL1, Accession NM_032852) is another VGAM954 host target gene. AUTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AUTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AUTL1 BINDING SITE, designated SEQ ID:26650, to the nucleotide sequence of VGAM954 RNA, herein designated VGAM RNA, also designated SEQ ID:3665.

[35790] Another function of VGAM954 is therefore inhibition of AUT-like 1, Cysteine Endopeptidase (*S. cerevisiae*) (AUTL1, Accession NM_032852). Accordingly, utilities of VGAM954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AUTL1. Phorbol-12-myristate-13-acetate-induced Protein 1 (PMAIP1, Accession NM_021127) is another VGAM954 host target gene. PMAIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

PMAIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMAIP1 BINDING SITE, designated SEQ ID:22099, to the nucleotide sequence of VGAM954 RNA, herein designated VGAM RNA, also designated SEQ ID:3665.

[35791] Another function of VGAM954 is therefore inhibition of Phorbol-12-myristate-13-acetate-induced Protein 1 (PMAIP1, Accession NM_021127). Accordingly, utilities of VGAM954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMAIP1. PRO2037 (Accession NM_018616) is another VGAM954 host target gene. PRO2037 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2037, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2037 BINDING SITE, designated SEQ ID:20688, to the nucleotide sequence of VGAM954 RNA, herein designated VGAM RNA, also designated SEQ ID:3665.

[35792] Another function of VGAM954 is therefore inhibition of

PRO2037 (Accession NM_018616). Accordingly, utilities of VGAM954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2037. LOC149711 (Accession XM_097720) is another VGAM954 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:41069, to the nucleotide sequence of VGAM954 RNA, herein designated VGAM RNA, also designated SEQ ID:3665.

[35793] Another function of VGAM954 is therefore inhibition of LOC149711 (Accession XM_097720). Accordingly, utilities of VGAM954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711. LOC158156 (Accession XM_088496) is another VGAM954 host target gene. LOC158156 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC158156 BINDING SITE, designated SEQ ID:39737, to the nucleotide sequence of VGAM954 RNA, herein designated VGAM RNA, also designated SEQ ID:3665.

[35794] Another function of VGAM954 is therefore inhibition of LOC158156 (Accession XM_088496). Accordingly, utilities of VGAM954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158156. LOC162137 (Accession XM_102426) is another VGAM954 host target gene. LOC162137 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC162137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162137 BINDING SITE, designated SEQ ID:42116, to the nucleotide sequence of VGAM954 RNA, herein designated VGAM RNA, also designated SEQ ID:3665.

[35795] Another function of VGAM954 is therefore inhibition of LOC162137 (Accession XM_102426). Accordingly, utilities of VGAM954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162137. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 955 (VGAM955) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35796] VGAM955 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM955 was detected is described hereinabove with reference to Figs. 1–8.

[35797] VGAM955 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Spotted Wilt Virus. VGAM955 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35798] VGAM955 gene encodes a VGAM955 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM955 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM955 precursor RNA is designated SEQ ID:941, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:941 is

located at position 4126 relative to the genome of Tomato Spotted Wilt Virus.

[35799] VGAM955 precursor RNA folds onto itself, forming VGAM955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35800] An enzyme complex designated DICER COMPLEX, `dices` the VGAM955 folded precursor RNA into VGAM955 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM955 RNA is designated SEQ ID:3666, and is provided hereinbelow with reference to the sequence listing part.

[35801] VGAM955 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM955 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM955 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[35802] VGAM955 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM955 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM955 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM955 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM955 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[35803] The complementary binding of VGAM955 RNA, herein designated VGAM RNA, to host target binding sites on VGAM955 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM955 host target RNA into VGAM955 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35804] It is appreciated that VGAM955 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM955 host target genes. The mRNA of each one of this plurality of VGAM955 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM955 RNA, herein designated VGAM RNA, and which when bound by VGAM955 RNA causes inhibition of translation of respective one or more VGAM955

host target proteins.

[35805] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM955 gene, herein designated VGAM GENE, on one or more VGAM955 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35806] It is yet further appreciated that a function of VGAM955 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of viral infection by Tomato Spotted Wilt Virus.

Specific functions, and accordingly utilities, of VGAM955 correlate with, and may be deduced from, the identity of the host target genes which VGAM955 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35807] Nucleotide sequences of the VGAM955 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM955 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM955 are further described hereinbelow with reference to Table 1.

[35808] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM955 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM955 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35809] As mentioned hereinabove with reference to Fig. 1, a function of VGAM955 gene, herein designated VGAM is inhibition of expression of VGAM955 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM955 correlate with, and may be deduced from, the identity of the target genes which VGAM955 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35810] ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028) is a VGAM955 host target gene. ATP11A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11A BINDING SITE, designated SEQ ID:37806, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35811] A function of VGAM955 is therefore inhibition of ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11A. Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM_024812) is another VGAM955 host target gene. BAALC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAALC, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAALC BINDING SITE, designated SEQ ID:24199, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35812] Another function of VGAM955 is therefore inhibition of Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM_024812). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAALC. Cytochrome P450, Subfamily IIIA (nifedipine oxidase), Polypeptide 4 (CYP3A4, Accession NM_017460) is another VGAM955 host target gene. CYP3A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP3A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP3A4 BINDING SITE, designated SEQ ID:18932, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35813] Another function of VGAM955 is therefore inhibition of

Cytochrome P450, Subfamily IIIA (nifedipine oxidase), Polypeptide 4 (CYP3A4, Accession NM_017460), a gene which may be involved in an nadph-dependent electron transport pathway. Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP3A4. The function of CYP3A4 has been established by previous studies.

Watkins et al. (1985) identified a glucocorticoid-inducible cytochrome P450 in human liver. Molowa et al. (1986) reported the complete cDNA sequence of this P450.

Wrighton and Vandenbranden (1989) isolated a CYP3-type cytochrome P450 from human fetal liver. By somatic cell hybridization and in situ hybridization, Riddell et al.

(1987) assigned to chromosome 7 the gene for a cytochrome P450 that encodes the enzyme nifedipine oxidase (CYP3). The assignment to chromosome 7 was corroborated by Gonzalez et al. (1988) by use of somatic cell hybrids. These authors also provided additional evidence supporting the identity of P450PCN1 and nifedipine oxidase. By multipoint linkage analysis using DNA markers known to be located on chromosome 7, Brooks et al.

(1988) concluded that the most likely location of CYP3 is 7q21-q22.1. No recombination with a COL1A2 (OMIM Ref.

No. 120160) marker was found. Spurr et al. (1989) assigned CYP3 to 7q22-qter by study of a panel of human-rodent somatic cell hybrids. Inoue et al. (1992) mapped CYP3A4 to 7q22.1 by fluorescence in situ hybridization. The induction of CYP3A enzymes is species-specific and believed to involve 1 or more cellular factors, or receptor-like xenosensors. Xie et al. (2000) identified PXR/SXR as one such factor. They showed that targeted disruption of the mouse Pxr gene abolished induction of CYP3A by prototypic inducers such as dexamethasone or pregnenolone-16- α -carbonitrile. In Pxr-null mice carrying a transgene for an activated form of human SXR, there was constitutive upregulation of CYP3A gene expression and enhanced protection against toxic xenobiotic compounds. Xie et al. (2000) demonstrated that species origin of the receptor, rather than the promoter structure of the CYP3A genes, dictates the species-specific pattern of CYP3A inducibility. Thus, they could generate 'humanized' transgenic mice that were responsive to human-specific inducers such as the antibiotic rifampicin. Xie et al. (2000) concluded that the SXR/PXR genes encode the primary species-specific xenosensors that mediate the adaptive hepatic response, and may represent the critical biochem-

ical mechanism of human xenoprotection.

[35814] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35815] Inoue, K.; Inazawa, J.; Nakagawa, H.; Shimada, T.; Yamazaki, H.; Guengerich, F. P.; Abe, T. : Assignment of the human cytochrome P-450 nifedipine oxidase gene (CYP3A4) to chromosome 7 at band q22.1 by fluorescence in situ hybridization. Jpn. J. Hum. Genet. 37: 133-138, 1992. ; and

[35816] Xie, W.; Barwick, J. L.; Downes, M.; Blumberg, B.; Simon, C. M.; Nelson, M. C.; Neuschwander-Tetri, B. A.; Brunt, E. M.; Guzelian, P. S.; Evans, R. M. : Humanized xenobiotic response.

[35817] Further studies establishing the function and utilities of CYP3A4 are found in John Hopkins OMIM database record ID 124010, and in cited publications numbered 3412-3425, 12760-12761, 3426-3428, 366 and 3672-3681 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM_003583) is another VGAM955 host target gene. DYRK2 BINDING SITE1 and

DYRK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2, designated SEQ ID:9631 and SEQ ID:13207 respectively, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35818] Another function of VGAM955 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM_003583). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK2. Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM_016348) is another VGAM955 host target gene. C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C5orf4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf4

BINDING SITE1 and C5orf4 BINDING SITE2, designated SEQ ID:18477 and SEQ ID:26186 respectively, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35819] Another function of VGAM955 is therefore inhibition of Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM_016348). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4. DKFZp434F142 (Accession NM_032254) is another VGAM955 host target gene. DKFZp434F142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434F142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434F142 BINDING SITE, designated SEQ ID:25996, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35820] Another function of VGAM955 is therefore inhibition of DKFZp434F142 (Accession NM_032254). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp434F142. DKFZP434K1772 (Accession XM_041936) is another VGAM955 host target gene. DKFZP434K1772 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434K1772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K1772 BINDING SITE, designated SEQ ID:33632, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35821] Another function of VGAM955 is therefore inhibition of DKFZP434K1772 (Accession XM_041936). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K1772. Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM_057927) is another VGAM955 host target gene. FHOD2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FHOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHOD2 BINDING

SITE, designated SEQ ID:36551, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35822] Another function of VGAM955 is therefore inhibition of Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM_057927). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHOD2. FLJ14437 (Accession NM_032578) is another VGAM955 host target gene. FLJ14437 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14437 BINDING SITE, designated SEQ ID:26309, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35823] Another function of VGAM955 is therefore inhibition of FLJ14437 (Accession NM_032578). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14437. KIAA0084 (Accession XM_042841) is another VGAM955

host target gene. KIAA0084 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0084 BINDING SITE, designated SEQ ID:33807, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35824] Another function of VGAM955 is therefore inhibition of KIAA0084 (Accession XM_042841). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0084. MGC3130 (Accession NM_024032) is another VGAM955 host target gene. MGC3130 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3130 BINDING SITE, designated SEQ ID:23462, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35825] Another function of VGAM955 is therefore inhibition of MGC3130 (Accession NM_024032). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3130. PBX/knotted 1 Homeobox 2 (PKNOX2, Accession XM_165574) is another VGAM955 host target gene. PKNOX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKNOX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKNOX2 BINDING SITE, designated SEQ ID:43694, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35826] Another function of VGAM955 is therefore inhibition of PBX/knotted 1 Homeobox 2 (PKNOX2, Accession XM_165574). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKNOX2. SBB103 (Accession NM_005785) is another VGAM955 host target gene. SBB103 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SBB103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBB103 BINDING SITE, designated SEQ ID:12368, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35827] Another function of VGAM955 is therefore inhibition of SBB103 (Accession NM_005785). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBB103. SCOP (Accession XM_166290) is another VGAM955 host target gene. SCOP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCOP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCOP BINDING SITE, designated SEQ ID:44103, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35828] Another function of VGAM955 is therefore inhibition of SCOP (Accession XM_166290). Accordingly, utilities of

VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCOP.

TIP120A (Accession NM_018448) is another VGAM955 host target gene. TIP120A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIP120A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIP120A BINDING SITE, designated SEQ ID:20517, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35829] Another function of VGAM955 is therefore inhibition of TIP120A (Accession NM_018448). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIP120A. TRIAD3 (Accession XM_170517) is another VGAM955 host target gene. TRIAD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIAD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIAD3 BINDING SITE, designated

SEQ ID:45349, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35830] Another function of VGAM955 is therefore inhibition of TRIAD3 (Accession XM_170517). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIAD3. Vav 3 Oncogene (VAV3, Accession NM_006113) is another VGAM955 host target gene. VAV3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAV3 BINDING SITE, designated SEQ ID:12759, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35831] Another function of VGAM955 is therefore inhibition of Vav 3 Oncogene (VAV3, Accession NM_006113). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAV3. ZNF361 (Accession NM_018555) is another VGAM955 host target gene. ZNF361 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF361 BINDING SITE, designated SEQ ID:20635, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35832] Another function of VGAM955 is therefore inhibition of ZNF361 (Accession NM_018555). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF361. LOC144161 (Accession XM_096548) is another VGAM955 host target gene. LOC144161 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144161 BINDING SITE, designated SEQ ID:40389, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35833] Another function of VGAM955 is therefore inhibition of

LOC144161 (Accession XM_096548). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144161. LOC150035 (Accession XM_097793) is another VGAM955 host target gene. LOC150035 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150035 BINDING SITE, designated SEQ ID:41121, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35834] Another function of VGAM955 is therefore inhibition of LOC150035 (Accession XM_097793). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150035. LOC151098 (Accession XM_087096) is another VGAM955 host target gene. LOC151098 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC151098 BINDING SITE, designated SEQ ID:39049, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35835] Another function of VGAM955 is therefore inhibition of LOC151098 (Accession XM_087096). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151098. LOC219540 (Accession XM_168047) is another VGAM955 host target gene. LOC219540 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219540 BINDING SITE, designated SEQ ID:44957, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35836] Another function of VGAM955 is therefore inhibition of LOC219540 (Accession XM_168047). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219540. LOC257475 (Accession XM_051670) is an-

other VGAM955 host target gene. LOC257475 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257475 BINDING SITE, designated SEQ ID:35860, to the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, also designated SEQ ID:3666.

[35837] Another function of VGAM955 is therefore inhibition of LOC257475 (Accession XM_051670). Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257475. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 956 (VGAM956) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35838] VGAM956 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM956 was detected is described

hereinabove with reference to Figs. 1–8.

[35839] VGAM956 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Spotted Wilt Virus. VGAM956 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35840] VGAM956 gene encodes a VGAM956 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM956 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM956 precursor RNA is designated SEQ ID:942, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:942 is located at position 3426 relative to the genome of Tomato Spotted Wilt Virus.

[35841] VGAM956 precursor RNA folds onto itself, forming VGAM956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35842] An enzyme complex designated DICER COMPLEX, `dices` the VGAM956 folded precursor RNA into VGAM956 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM956 RNA is designated SEQ ID:3667, and is provided hereinbelow with reference to the sequence listing part.

[35843] VGAM956 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM956 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM956 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35844] VGAM956 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM956 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM956 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM956 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM956 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35845] The complementary binding of VGAM956 RNA, herein designated VGAM RNA, to host target binding sites on VGAM956 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM956 host target RNA into VGAM956 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35846] It is appreciated that VGAM956 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM956 host target genes. The mRNA of each one of this plurality of VGAM956 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM956 RNA, herein designated VGAM RNA, and which when bound by VGAM956 RNA causes inhibition of translation of respective one or more VGAM956 host target proteins.

[35847] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM956 gene, herein designated VGAM GENE, on one or more VGAM956 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35848] It is yet further appreciated that a function of VGAM956 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM956 include diagnosis, prevention and treatment of viral infection by Tomato Spotted Wilt Virus. Specific functions, and accordingly utilities, of VGAM956 correlate with, and may be deduced from, the identity of the host target genes which VGAM956 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35849] Nucleotide sequences of the VGAM956 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM956 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM956 are further described hereinbelow with reference to Table 1.

[35850] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM956 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM956 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35851] As mentioned hereinabove with reference to Fig. 1, a function of VGAM956 gene, herein designated VGAM is inhibition of expression of VGAM956 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM956 correlate with, and may be deduced from, the identity of the target genes which VGAM956 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35852] JJAZ1 (Accession NM_015355) is a VGAM956 host target gene. JJAZ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JJAZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of JJAZ1 BINDING SITE, designated SEQ ID:17656, to the nucleotide sequence of VGAM956 RNA, herein designated VGAM RNA, also designated SEQ ID:3667.

[35853] A function of VGAM956 is therefore inhibition of JJAZ1 (Accession NM_015355), a gene which is a zinc finger protein. Accordingly, utilities of VGAM956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JJAZ1. The function of JJAZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM231. NEBL (Accession NM_006393) is another VGAM956 host target gene. NEBL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEBL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEBL BINDING SITE, designated SEQ ID:13099, to the nucleotide sequence of VGAM956 RNA, herein designated VGAM RNA, also designated SEQ ID:3667.

[35854] Another function of VGAM956 is therefore inhibition of NEBL (Accession NM_006393). Accordingly, utilities of

VGAM956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEBL.

TEM7 (Accession NM_020405) is another VGAM956 host target gene. TEM7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM7 BINDING SITE, designated SEQ ID:21671, to the nucleotide sequence of VGAM956 RNA, herein designated VGAM RNA, also designated SEQ ID:3667.

[35855] Another function of VGAM956 is therefore inhibition of TEM7 (Accession NM_020405), a gene which involves in angiogenesis. Accordingly, utilities of VGAM956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM7. The function of TEM7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM23.FLJ11274 (Accession NM_018375) is another VGAM956 host target gene. FLJ11274 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by FLJ11274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11274 BINDING SITE, designated SEQ ID:20397, to the nucleotide sequence of VGAM956 RNA, herein designated VGAM RNA, also designated SEQ ID:3667.

[35856] Another function of VGAM956 is therefore inhibition of FLJ11274 (Accession NM_018375). Accordingly, utilities of VGAM956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11274. MGC12981 (Accession NM_032357) is another VGAM956 host target gene. MGC12981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12981 BINDING SITE, designated SEQ ID:26142, to the nucleotide sequence of VGAM956 RNA, herein designated VGAM RNA, also designated SEQ ID:3667.

[35857] Another function of VGAM956 is therefore inhibition of MGC12981 (Accession NM_032357). Accordingly, utilities

of VGAM956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12981. LOC143310 (Accession XM_084485) is another VGAM956 host target gene. LOC143310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143310 BINDING SITE, designated SEQ ID:37610, to the nucleotide sequence of VGAM956 RNA, herein designated VGAM RNA, also designated SEQ ID:3667.

[35858] Another function of VGAM956 is therefore inhibition of LOC143310 (Accession XM_084485). Accordingly, utilities of VGAM956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143310. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 957 (VGAM957) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35859] VGAM957 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM957 was detected is described hereinabove with reference to Figs. 1–8.

[35860] VGAM957 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Spotted Wilt Virus. VGAM957 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35861] VGAM957 gene encodes a VGAM957 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM957 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM957 precursor RNA is designated SEQ ID:943, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:943 is located at position 704 relative to the genome of Tomato Spotted Wilt Virus.

[35862] VGAM957 precursor RNA folds onto itself, forming VGAM957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35863] An enzyme complex designated DICER COMPLEX, `dices` the VGAM957 folded precursor RNA into VGAM957 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM957 RNA is designated SEQ ID:3668, and is provided hereinbelow with reference to the sequence listing part.

[35864] VGAM957 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM957 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM957 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[35865] VGAM957 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM957 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM957 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM957 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM957 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35866] The complementary binding of VGAM957 RNA, herein designated VGAM RNA, to host target binding sites on VGAM957 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM957 host target RNA into VGAM957 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35867] It is appreciated that VGAM957 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM957 host target genes. The mRNA of each one of this plurality of VGAM957 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM957 RNA, herein designated VGAM RNA, and which when bound by VGAM957 RNA causes inhibition of translation of respective one or more VGAM957 host target proteins.

[35868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM957 gene, herein designated VGAM GENE, on one or more VGAM957 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35869] It is yet further appreciated that a function of VGAM957 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of viral infection by Tomato Spotted Wilt Virus. Specific functions, and accordingly utilities, of VGAM957 correlate with, and may be deduced from, the identity of the host target genes which VGAM957 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35870] Nucleotide sequences of the VGAM957 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM957 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM957 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM957 are further
described hereinbelow with reference to Table 1.

[35871] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM957 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM957 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[35872] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM957 gene, herein designated VGAM is
inhibition of expression of VGAM957 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM957 correlate with, and may be deduced
from, the identity of the target genes which VGAM957
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[35873] Golgi Autoantigen, Golgin Subfamily A, 4 (GOLGA4, Ac-
cession XM_011069) is a VGAM957 host target gene.

GOLGA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLGA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA4 BINDING SITE, designated SEQ ID:30165, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35874] A function of VGAM957 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 4 (GOLGA4, Accession XM_011069), a gene which may play a role in vesicular transport from the trans- golgi. Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA4. The function of GOLGA4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM841. Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM_002540) is another VGAM957 host target gene. ODF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ODF2, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ODF2 BINDING SITE, designated SEQ ID:8389, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35875] Another function of VGAM957 is therefore inhibition of Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM_002540), a gene which is very strongly similar to rat Odf2 . Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ODF2. The function of ODF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM363. Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430) is another VGAM957 host target gene. PAFAH1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAFAH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH1B1 BINDING SITE, designated SEQ

ID:6015, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35876] Another function of VGAM957 is therefore inhibition of Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH1B1. Steroid-5-alpha-reductase, Alpha Polypeptide 2 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 2) (SRD5A2, Accession XM_002471) is another VGAM957 host target gene. SRD5A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SRD5A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRD5A2 BINDING SITE, designated SEQ ID:29888, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35877] Another function of VGAM957 is therefore inhibition of Steroid-5-alpha-reductase, Alpha Polypeptide 2 (3-oxo-5

alpha-steroid delta 4-dehydrogenase alpha 2) (SRD5A2, Accession XM_002471). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRD5A2. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM957 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15358, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35878] Another function of VGAM957 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM172.Chromosome 20 Open Reading Frame 21 (C20orf21, Accession NM_017798) is another VGAM957 host target gene. C20orf21 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf21 BINDING SITE, designated SEQ ID:19443, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35879] Another function of VGAM957 is therefore inhibition of Chromosome 20 Open Reading Frame 21 (C20orf21, Accession NM_017798). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf21. DKFZP564O0423 (Accession XM_166254) is another VGAM957 host target gene. DKFZP564O0423 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DKFZP564O0423 BINDING SITE, designated SEQ ID:44071, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35880] Another function of VGAM957 is therefore inhibition of DKFZP564O0423 (Accession XM_166254). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423. FLJ13072 (Accession XM_117117) is another VGAM957 host target gene. FLJ13072 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13072 BINDING SITE, designated SEQ ID:43238, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35881] Another function of VGAM957 is therefore inhibition of FLJ13072 (Accession XM_117117). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13072. FLJ20055 (Accession NM_017643) is another VGAM957

host target gene. FLJ20055 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20055 BINDING SITE, designated SEQ ID:19147, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35882] Another function of VGAM957 is therefore inhibition of FLJ20055 (Accession NM_017643). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20055. MGC14798 (Accession NM_080650) is another VGAM957 host target gene. MGC14798 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC14798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14798 BINDING SITE, designated SEQ ID:27939, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35883] Another function of VGAM957 is therefore inhibition of MGC14798 (Accession NM_080650). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14798. Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM_046751) is another VGAM957 host target gene. PPFIA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPFIA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPFIA4 BINDING SITE, designated SEQ ID:34823, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35884] Another function of VGAM957 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM_046751). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPFIA4. PR Domain Containing 8 (PRDM8, Accession NM_020226) is another

VGAM957 host target gene. PRDM8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRDM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM8 BINDING SITE, designated SEQ ID:21492, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35885] Another function of VGAM957 is therefore inhibition of PR Domain Containing 8 (PRDM8, Accession NM_020226). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM8. LOC129607 (Accession XM_059368) is another VGAM957 host target gene. LOC129607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129607 BINDING SITE, designated SEQ ID:36977, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3668.

[35886] Another function of VGAM957 is therefore inhibition of LOC129607 (Accession XM_059368). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129607. LOC196424 (Accession XM_113718) is another VGAM957 host target gene. LOC196424 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196424 BINDING SITE, designated SEQ ID:42370, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35887] Another function of VGAM957 is therefore inhibition of LOC196424 (Accession XM_113718). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196424. LOC199692 (Accession NM_145295) is another VGAM957 host target gene. LOC199692 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199692, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199692 BINDING SITE, designated SEQ ID:29812, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35888] Another function of VGAM957 is therefore inhibition of LOC199692 (Accession NM_145295). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199692. LOC199848 (Accession XM_117144) is another VGAM957 host target gene. LOC199848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199848 BINDING SITE, designated SEQ ID:43250, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35889] Another function of VGAM957 is therefore inhibition of LOC199848 (Accession XM_117144). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC199848. LOC90841 (Accession XM_034427) is another VGAM957 host target gene. LOC90841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90841 BINDING SITE, designated SEQ ID:32113, to the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, also designated SEQ ID:3668.

[35890] Another function of VGAM957 is therefore inhibition of LOC90841 (Accession XM_034427). Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90841. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 958 (VGAM958) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[35891] VGAM958 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM958 was detected is described hereinabove with reference to Figs. 1–8.

[35892] VGAM958 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Spotted Wilt Virus. VGAM958 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[35893] VGAM958 gene encodes a VGAM958 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM958 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM958 precursor RNA is designated SEQ ID:944, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:944 is located at position 2556 relative to the genome of Tomato Spotted Wilt Virus.

[35894] VGAM958 precursor RNA folds onto itself, forming VGAM958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35895] An enzyme complex designated DICER COMPLEX, `dices` the VGAM958 folded precursor RNA into VGAM958 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM958 RNA is designated SEQ ID:3669, and is provided hereinbelow with reference to the sequence listing part.

[35896] VGAM958 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM958 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM958 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[35897] VGAM958 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM958 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM958 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM958 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM958 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[35898] The complementary binding of VGAM958 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM958 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM958 host target RNA into VGAM958 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[35899] It is appreciated that VGAM958 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM958 host target genes. The mRNA of each one of this plurality of VGAM958 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM958 RNA, herein designated VGAM RNA, and which when bound by VGAM958 RNA causes inhibition of translation of respective one or more VGAM958 host target proteins.

[35900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM958 gene, herein designated VGAM GENE, on one or more VGAM958 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[35901] It is yet further appreciated that a function of VGAM958 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of viral infection by Tomato Spotted Wilt Virus. Specific functions, and accordingly utilities, of VGAM958 correlate with, and may be deduced from, the identity of the host target genes which VGAM958 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[35902] Nucleotide sequences of the VGAM958 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM958 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM958 are further described hereinbelow with reference to Table 1.

[35903] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM958 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM958 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[35904] As mentioned hereinabove with reference to Fig. 1, a function of VGAM958 gene, herein designated VGAM is inhibition of expression of VGAM958 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM958 correlate with, and may be deduced from, the identity of the target genes which VGAM958 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35905] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM_004776) is a VGAM958 host target gene. B4GALT5 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ ID:11172, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35906] A function of VGAM958 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM_004776). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT5. Basigin (OK blood group) (BSG, Accession NM_001728) is another VGAM958 host target gene. BSG BINDING SITE1 and BSG BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BSG, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSG BINDING SITE1 and BSG BINDING SITE2, designated SEQ ID:7458 and SEQ ID:33669 respectively, to the nucleotide sequence of VGAM958 RNA,

herein designated VGAM RNA, also designated SEQ ID:3669.

[35907] Another function of VGAM958 is therefore inhibition of Basigin (OK blood group) (BSG, Accession NM_001728), a gene which is a LEUKOCYTE ACTIVATION ANTIGEN and a member of the immunoglobulin superfamily. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSG. The function of BSG has been established by previous studies. Basigin is a member of the immunoglobulin superfamily, with a structure related to the putative primordial form of the family. It was cloned as a carrier of an oncodevelopmental carbohydrate marker expressed in teratocarcinoma stem cells. It is expressed broadly in both embryos and adults (4,5:Miyauchi et al., 1990, 1991; Kanekura et al., 1991). As members of the immunoglobulin superfamily play fundamental roles in intercellular recognition involved in various immunologic phenomena, differentiation, and development, basigin is thought also to play a role in intercellular recognition. Animal model experiments lend further support to the function of BSG. Naruhashi et al. (1997) generated mice deficient in basigin by targeted disruption. Bsg ^{-/-} mice

showed worse performance than their wildtype and heterozygous littermates in the Y-maze task, which assesses short-term memory, and in the water-finding task, which examines latent learning, without any motor dysfunction. Moreover, the mutant mice showed less acclimation in the habituation task compared with the wildtype mice. The mutant mice were also more sensitive to electric foot shock. Naruhashi et al. (1997) found these findings consistent with the expression profile of basigin in the central nervous system and suggested that basigin may play an important role in learning and memory as well as in sensory functions

[35908] It is appreciated that the abovementioned animal model for BSG is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[35909] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35910] Kanekura, T.; Miyauchi, T.; Tashiro, M.; Muramatsu, T. : Basigin, a new member of the immunoglobulin superfamily: genes in different mammalian species, glycosylation changes in the molecule from adult organs and possible

variation in the N-terminal sequences. Cell Struct. Funct. 16: 23–30, 1991. ; and

[35911] Naruhashi, K.; Kadomatsu, K.; Igakura, T.; Fan, Q.-W.; Kuno, N.; Muramatsu, H.; Miyauchi, T.; Hasegawa, T.; Itoh, A.; Muramatsu, T.; Nabeshima, T. : Abnormalities of sensory and memor.

[35912] Further studies establishing the function and utilities of BSG are found in John Hopkins OMIM database record ID 109480, and in cited publications numbered 21–2 and 1711 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dystrophia Myotonica–protein Kinase (DMPK, Accession NM_004409) is another VGAM958 host target gene. DMPK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMPK BINDING SITE, designated SEQ ID:10665, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35913] Another function of VGAM958 is therefore inhibition of Dystrophia Myotonica–protein Kinase (DMPK, Accession

NM_004409). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMPK. DXYS155E (Accession NM_005088) is another VGAM958 host target gene. DXYS155E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DXYS155E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXYS155E BINDING SITE, designated SEQ ID:11544, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35914] Another function of VGAM958 is therefore inhibition of DXYS155E (Accession NM_005088), a gene which may be involved in b-cell activation. may also be involved in signal transduction and gene regulation. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXYS155E. The function of DXYS155E and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM766.Erythropoietin (EPO, Accession

NM_000799) is another VGAM958 host target gene. EPO BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EPO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPO BINDING SITE, designated SEQ ID:6468, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35915] Another function of VGAM958 is therefore inhibition of Erythropoietin (EPO, Accession NM_000799). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPO. GA Binding Protein Transcription Factor, Beta Subunit 1, 53kDa (GABPB1, Accession NM_005254) is another VGAM958 host target gene. GABPB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABPB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABPB1 BINDING SITE, designated SEQ ID:11761, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM

RNA, also designated SEQ ID:3669.

[35916] Another function of VGAM958 is therefore inhibition of GA Binding Protein Transcription Factor, Beta Subunit 1, 53kDa (GABPB1, Accession NM_005254), a gene which activates adenovirus E4 gene transcription. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABPB1. The function of GABPB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463) is another VGAM958 host target gene. HNRPDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:11949, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35917] Another function of VGAM958 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D-like

(HNRPDL, Accession NM_005463), a gene which binds to rna molecules that contain au-rich elements. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL. The function of HNRPDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. Lactate Dehydrogenase B (LDHB, Accession NM_002300) is another VGAM958 host target gene. LDHB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LDHB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDHB BINDING SITE, designated SEQ ID:8090, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35918] Another function of VGAM958 is therefore inhibition of Lactate Dehydrogenase B (LDHB, Accession NM_002300), a gene which causes dehydrogenation of lactate. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with LDHB. The function of LDHB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273. Mannosidase, Alpha, Class 2C, Member 1 (MAN2C1, Accession XM_053585) is another VGAM958 host target gene. MAN2C1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAN2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN2C1 BINDING SITE, designated SEQ ID:36103, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35919] Another function of VGAM958 is therefore inhibition of Mannosidase, Alpha, Class 2C, Member 1 (MAN2C1, Accession XM_053585), a gene which is Strongly similar to a region of rat ER alpha-mannosidase. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN2C1. The function of MAN2C1 has been established by previous studies. Cytoplasmic alpha-mannosidase (MANA) was assigned to 15q11-qter by study of an X;15

translocation in man–mouse hybrids (Champion et al., 1978). Lysosomal alpha–mannosidase (MANB) has been assigned to chromosome 19 by somatic cell hybridization (see OMIM Ref. No. 248500). Neri et al. (1983) described a boy with a ring chromosome 15 derived from a t(15q;15q) chromosome of the mother. The ring chromosome was duplicated for a portion of the long arms near the centromere, probably cen–q13. Dosage effects suggested that the alpha–mannosidase gene is located in this segment. Since a shortest region of overlap (SRO) of 15q11–qter had been estimated by Ferguson–Smith and Westerveld (1979), the new information places the MAN2C1 gene in the 15q11–q13 segment.

[35920] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35921] Ferguson–Smith, M. A.; Westerveld, A. : Report of the committee on the genetic constitution of chromosomes 13, 14, 15, 16, 17, 18, 19, 20, 21, and 22 (HGM5). Cytogenet. Cell Genet. 25: 59–73, 1979. ; and

[35922] Neri, G.; Ricci, R.; Pelino, A.; Bova, R.; Tedeschi, B.; Serra, A. : A boy with ring chromosome 15 derived from a t(15q;15q) Robertsonian translocation in the mother: cy–

togenetic and bio.

[35923] Further studies establishing the function and utilities of MAN2C1 are found in John Hopkins OMIM database record ID 154580, and in cited publications numbered 11523–11525 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Methionine Adenosyltransferase I, Alpha (MAT1A, Accession XM_165540) is another VGAM958 host target gene. MAT1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAT1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAT1A BINDING SITE, designated SEQ ID:43670, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35924] Another function of VGAM958 is therefore inhibition of Methionine Adenosyltransferase I, Alpha (MAT1A, Accession XM_165540). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAT1A. Metallothionein-like 5, Testis-specific (tesmin) (MTL5, Accession

NM_004923) is another VGAM958 host target gene. MTL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTL5 BINDING SITE, designated SEQ ID:11360, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35925] Another function of VGAM958 is therefore inhibition of Metallothionein-like 5, Testis-specific (tesmin) (MTL5, Accession NM_004923), a gene which functions in metal homeostasis and protects against heavy-metal toxicity. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTL5. The function of MTL5 has been established by previous studies. By randomized RT-PCR on mRNA from mouse tissues, Sugihara et al. (1999) isolated a testis-specific transcript, which they called TF1. By screening a human testis cDNA library with TF1 as a probe, they cloned a novel cDNA, which they called testis-specific metallothionein-like protein, or tesmin. Tesmin encodes a predicted cysteine-rich, 295-amino acid pro-

tein that is 76.3% homologous to mouse tesmin. Sequence analysis revealed the presence of 2 metallothionein (MT)–like motifs. MT expression has been observed to be higher in testes than in liver tissue (Salehi–Ashtiani et al., 1993) and to be actively expressed in a developmentally regulated fashion in mouse male germ cells (De et al., 1991). Tesmin shows no homology to other testis–specific genes. In situ hybridization of adult mouse testicular sections showed that expression of tesmin is restricted to spermatocytes. RT–PCR analysis on testicular transcripts from mice showed that expression of tesmin occurs as early as day 8 and coincides with the entry of germ cells in meiosis.

[35926] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35927] De, S. K.; Enders, G. C.; Andrews, G. K. : High levels of metallothionein messenger RNAs in male germ cells of the adult mouse. *Molec. Endocr.* 5: 628–636, 1991. ; and

[35928] Salehi–Ashtiani, K.; Widrow, R. J.; Markert, C. L.; Goldberg, E. : Testis–specific expression of a metallothionein I–driven transgene correlates with undermethylation of the locus in te.

[35929] Further studies establishing the function and utilities of MTL5 are found in John Hopkins OMIM database record ID 604374, and in cited publications numbered 6921–6923 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myosin, Heavy Polypeptide 11, Smooth Muscle (MYH11, Accession NM_002474) is another VGAM958 host target gene. MYH11 BINDING SITE1 and MYH11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MYH11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH11 BINDING SITE1 and MYH11 BINDING SITE2, designated SEQ ID:8302 and SEQ ID:23144 respectively, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35930] Another function of VGAM958 is therefore inhibition of Myosin, Heavy Polypeptide 11, Smooth Muscle (MYH11, Accession NM_002474), a gene which is involved in muscle contraction. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH11. The function of

MYH11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Peptidylprolyl Isomerase F (cyclophilin F) (PPIF, Accession NM_005729) is another VGAM958 host target gene. PPIF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIF BINDING SITE, designated SEQ ID:12283, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35931] Another function of VGAM958 is therefore inhibition of Peptidylprolyl Isomerase F (cyclophilin F) (PPIF, Accession NM_005729), a gene which catalyzes the cis to trans isomerization of certain proline imidic peptide bonds in oligopeptides. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIF. The function of PPIF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM251. Protein S

(alpha) (PROS1, Accession XM_113400) is another VGAM958 host target gene. PROS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PROS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROS1 BINDING SITE, designated SEQ ID:42257, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35932] Another function of VGAM958 is therefore inhibition of Protein S (alpha) (PROS1, Accession XM_113400). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROS1. Reticulon 3 (RTN3, Accession XM_058207) is another VGAM958 host target gene. RTN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTN3 BINDING SITE, designated SEQ ID:36587, to the nucleotide sequence of VGAM958 RNA, herein designated

VGAM RNA, also designated SEQ ID:3669.

[35933] Another function of VGAM958 is therefore inhibition of Reticulon 3 (RTN3, Accession XM_058207), a gene which is a member of the reticulon (neuroendocrine-specific, NSP) family. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTN3. The function of RTN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM596. Secreted and Transmembrane 1 (SECTM1, Accession NM_003004) is another VGAM958 host target gene. SECTM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SECTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SECTM1 BINDING SITE, designated SEQ ID:8911, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35934] Another function of VGAM958 is therefore inhibition of Secreted and Transmembrane 1 (SECTM1, Accession NM_003004). Accordingly, utilities of VGAM958 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SECTM1. Spectrin, Beta, Non-erythrocytic 4 (SPTBN4, Accession NM_025213) is another VGAM958 host target gene. SPTBN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTBN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTBN4 BINDING SITE, designated SEQ ID:24885, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35935] Another function of VGAM958 is therefore inhibition of Spectrin, Beta, Non-erythrocytic 4 (SPTBN4, Accession NM_025213), a gene which is critical for the maintenance of plasma membrane shape and lipid asymmetry. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTBN4. The function of SPTBN4 has been established by previous studies. Tse et al. (2001) cloned SPTBN4, which they termed SPTBN3, as well as a splice variant, sigma-5, encoding a 678-amino acid protein. Whole-mount in situ hybridization analysis revealed

Sptbn4 expression that was restricted to forebrain, hind-brain, and developing eye in postcoital day-9.5 mice. Western blot analysis with polyclonal antibodies detected expression of a predominant 72-kD protein, close to the expected size of the sigma-5 variant. Immunofluorescence microscopy demonstrated colocalization of SPTBN4 with PML (OMIM Ref. No. 102578) and with SUMO1 (UBL1; 601912) in the cytoplasm and nucleus. The authors showed that both the N- and C-terminal helical coils of sigma-5 are needed to form nuclear dots and are associated with the nuclear matrix. Tse et al. (2001) proposed that a spectrin-based skeleton may be important for the structure of the nucleus. Spectrins (e.g., SPTA1; 182860) are rod-shaped proteins that are part of the lattice-like cytoskeleton under the erythrocyte membrane. This meshwork is critical for the maintenance of plasma membrane shape and lipid asymmetry, as revealed by mutant spectrins in diseases such as elliptocytosis (see OMIM Ref. No. 182860) and spherocytosis (see OMIM Ref. No. 182870). Although originally identified in erythrocytes, spectrins have also been found in the membranes of intracellular organelles, such as the Golgi, lysosomes, and secretory vesicles. The spectrin molecule is a tetramer

consisting of 2 alpha and 2 beta subunits, in which the N terminus of an alpha subunit is tightly connected with the C terminus of a beta subunit to form a heterodimer. Spectrin repeats contain approximately 106 amino acids. Alpha subunits have 20 spectrin repeats, while beta subunits have 17. Animal model experiments lend further support to the function of SPTBN4. The autosomal recessive mouse mutation 'quivering' (qv), described by Yoon and Les (1957), produces progressive ataxia with hindlimb paralysis, deafness, and tremor. Ear twitch responses (Preyer reflex) to sound are absent in homozygous qv/qv mice, although cochlear morphology seems normal and cochlear potentials recorded at the round window are no different from those of control mice. However, responses from brain stem auditory nuclei show abnormal transmission of auditory information, indicating that in contrast to the many mutations causing deafness originating in the cochlea, deafness in qv is central in origin (Deol et al., 1983; Bock et al., 1983). Parkinson et al. (2001) reported that qv mice carry loss-of-function mutations in the Spnb4 gene that cause alterations in ion channel localization in myelinated nerves. They concluded that this finding provides a rationale for the auditory and motor neu-

ropathies of these mice.

[35936] It is appreciated that the abovementioned animal model for SPTBN4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[35937] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35938] Parkinson, N. J.; Olsson, C. L.; Hallows, J. L.; McKee-Johnson, J.; Keogh, B. P.; Noben-Trauth, K.; Kujawa, S. G.; Tempel, B. L. : Mutant beta-spectrin 4 causes auditory and motor neuropathies in quivering mice. Nature Genet. 29: 61-65, 2001. ; and

[35939] Tse, W. T.; Tang, J.; Jin, O.; Korsgren, C.; John, K. M.; Kung, A. L.; Gwynn, B.; Peters, L. L.; Lux, S. E. : A new spectrin, beta-IV, has a major truncated isoform that associates with pr.

[35940] Further studies establishing the function and utilities of SPTBN4 are found in John Hopkins OMIM database record ID 606214, and in cited publications numbered 6166-616 and 6730-6171 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TRIP15 (Accession NM_004236) is another VGAM958

host target gene. TRIP15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP15 BINDING SITE, designated SEQ ID:10433, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35941] Another function of VGAM958 is therefore inhibition of TRIP15 (Accession NM_004236), a gene which is a subunit of the COP9 signalosome complex. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP15. The function of TRIP15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM452. Zinc Finger Protein 36, C3H Type-like 1 (ZFP36L1, Accession NM_004926) is another VGAM958 host target gene. ZFP36L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFP36L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP36L1 BINDING SITE, designated SEQ ID:11366, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35942] Another function of VGAM958 is therefore inhibition of Zinc Finger Protein 36, C3H Type-like 1 (ZFP36L1, Accession NM_004926), a gene which is a regulatory protein involved in regulating the response to growth factors. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP36L1. The function of ZFP36L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. ADAR3 (Accession NM_018702) is another VGAM958 host target gene.

ADAR3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADAR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAR3 BINDING SITE, designated SEQ ID:20787, to the nucleotide sequence of VGAM958 RNA,

herein designated VGAM RNA, also designated SEQ ID:3669.

[35943] Another function of VGAM958 is therefore inhibition of ADAR3 (Accession NM_018702). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR3. Apolipoprotein L, 3 (APOL3, Accession NM_014349) is another VGAM958 host target gene. APOL3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by APOL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL3 BINDING SITE, designated SEQ ID:15676, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35944] Another function of VGAM958 is therefore inhibition of Apolipoprotein L, 3 (APOL3, Accession NM_014349). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL3. Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM_139177) is another VGAM958 host target gene. C17orf26 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C17orf26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf26 BINDING SITE, designated SEQ ID:29189, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35945] Another function of VGAM958 is therefore inhibition of Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM_139177). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf26. Chromosome 19 Open Reading Frame 7 (C19orf7, Accession XM_028253) is another VGAM958 host target gene. C19orf7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C19orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C19orf7 BINDING SITE, designated SEQ ID:30637, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ

ID:3669.

[35946] Another function of VGAM958 is therefore inhibition of Chromosome 19 Open Reading Frame 7 (C19orf7, Accession XM_028253). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C19orf7. Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172) is another VGAM958 host target gene. C1orf34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:30441, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35947] Another function of VGAM958 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. Chromosome 20 Open Reading Frame 150 (C20orf150, Accession

XM_037265) is another VGAM958 host target gene.

C20orf150 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf150 BINDING SITE, designated SEQ ID:32598, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35948] Another function of VGAM958 is therefore inhibition of Chromosome 20 Open Reading Frame 150 (C20orf150, Accession XM_037265). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf150. Chromosome 22 Open Reading Frame 5 (C22orf5, Accession NM_012264) is another VGAM958 host target gene. C22orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C22orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf5 BINDING SITE, designated SEQ

ID:14583, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35949] Another function of VGAM958 is therefore inhibition of Chromosome 22 Open Reading Frame 5 (C22orf5, Accession NM_012264). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf5. Calsyntenin 2 (CLSTN2, Accession NM_022131) is another VGAM958 host target gene. CLSTN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLSTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLSTN2 BINDING SITE, designated SEQ ID:22694, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35950] Another function of VGAM958 is therefore inhibition of Calsyntenin 2 (CLSTN2, Accession NM_022131). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLSTN2. Cyclin M4 (CNNM4, Accession

NM_020184) is another VGAM958 host target gene. CNNM4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNNM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM4 BINDING SITE, designated SEQ ID:21428, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35951] Another function of VGAM958 is therefore inhibition of Cyclin M4 (CNNM4, Accession NM_020184). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM4. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM_047295) is another VGAM958 host target gene. EPB41L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34945, to the nucleotide sequence of

VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35952] Another function of VGAM958 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM_047295). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665) is another VGAM958 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12217, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35953] Another function of VGAM958 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5. FLJ10619 (Accession NM_018156) is another VGAM958 host target gene.

FLJ10619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10619 BINDING SITE, designated SEQ ID:19969, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35954] Another function of VGAM958 is therefore inhibition of FLJ10619 (Accession NM_018156). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10619. FLJ10751 (Accession NM_018205) is another VGAM958 host target gene. FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10751, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2, designated SEQ ID:20096 and SEQ ID:20195 respectively, to the nucleotide sequence of VGAM958 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3669.

[35955] Another function of VGAM958 is therefore inhibition of FLJ10751 (Accession NM_018205). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10751. FLJ14642 (Accession NM_032818) is another VGAM958 host target gene. FLJ14642 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14642, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14642 BINDING SITE, designated SEQ ID:26596, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35956] Another function of VGAM958 is therefore inhibition of FLJ14642 (Accession NM_032818). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14642. FLJ20054 (Accession NM_019049) is another VGAM958 host target gene. FLJ20054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20054, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20054 BINDING SITE, designated SEQ ID:21131, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35957] Another function of VGAM958 is therefore inhibition of FLJ20054 (Accession NM_019049). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20054. FLJ20772 (Accession NM_017956) is another VGAM958 host target gene. FLJ20772 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20772 BINDING SITE, designated SEQ ID:19667, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35958] Another function of VGAM958 is therefore inhibition of FLJ20772 (Accession NM_017956). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20772. FLJ21657 (Accession NM_022483) is another VGAM958 host target gene. FLJ21657 BINDING SITE1 and FLJ21657 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ21657, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE1 and FLJ21657 BINDING SITE2, designated SEQ ID:22858 and SEQ ID:22859 respectively, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35959] Another function of VGAM958 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. H11 (Accession NM_014365) is another VGAM958 host target gene. H11 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by H11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H11 BINDING SITE, designated SEQ

ID:15695, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35960] Another function of VGAM958 is therefore inhibition of H11 (Accession NM_014365). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H11. Hyaluronan Binding Protein 2 (HABP2, Accession NM_004132) is another VGAM958 host target gene. HABP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HABP2 BINDING SITE, designated SEQ ID:10345, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35961] Another function of VGAM958 is therefore inhibition of Hyaluronan Binding Protein 2 (HABP2, Accession NM_004132). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HABP2. Integrin, Beta 5

(ITGB5, Accession XM_003029) is another VGAM958 host target gene. ITGB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB5 BINDING SITE, designated SEQ ID:29924, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35962] Another function of VGAM958 is therefore inhibition of Integrin, Beta 5 (ITGB5, Accession XM_003029). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB5. KIAA0040 (Accession NM_014656) is another VGAM958 host target gene. KIAA0040 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0040 BINDING SITE, designated SEQ ID:16100, to the nucleotide sequence of VGAM958 RNA, herein designated

VGAM RNA, also designated SEQ ID:3669.

[35963] Another function of VGAM958 is therefore inhibition of KIAA0040 (Accession NM_014656). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0040. KIAA0205 (Accession NM_014873) is another VGAM958 host target gene. KIAA0205 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0205 BINDING SITE, designated SEQ ID:17009, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35964] Another function of VGAM958 is therefore inhibition of KIAA0205 (Accession NM_014873). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0205. KIAA0319 (Accession NM_014809) is another VGAM958 host target gene. KIAA0319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0319, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0319 BINDING SITE, designated SEQ ID:16767, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35965] Another function of VGAM958 is therefore inhibition of KIAA0319 (Accession NM_014809). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0319. KIAA0481 (Accession XM_050144) is another VGAM958 host target gene. KIAA0481 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0481 BINDING SITE, designated SEQ ID:35572, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35966] Another function of VGAM958 is therefore inhibition of KIAA0481 (Accession XM_050144). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0481. KIAA1084 (Accession NM_014910) is another VGAM958 host target gene. KIAA1084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1084 BINDING SITE, designated SEQ ID:17140, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35967] Another function of VGAM958 is therefore inhibition of KIAA1084 (Accession NM_014910). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1084. KIAA1253 (Accession XM_166310) is another VGAM958 host target gene. KIAA1253 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1253, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1253 BINDING SITE, designated SEQ ID:44133, to the

nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35968] Another function of VGAM958 is therefore inhibition of KIAA1253 (Accession XM_166310). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1253. KIAA1500 (Accession XM_034353) is another VGAM958 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32071, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35969] Another function of VGAM958 is therefore inhibition of KIAA1500 (Accession XM_034353). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1500. KIAA1673 (Accession XM_047672) is another VGAM958 host target gene. KIAA1673 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1673 BINDING SITE, designated SEQ ID:35027, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35970] Another function of VGAM958 is therefore inhibition of KIAA1673 (Accession XM_047672). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1673. KIAA1719 (Accession XM_042936) is another VGAM958 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33827, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35971] Another function of VGAM958 is therefore inhibition of KIAA1719 (Accession XM_042936). Accordingly, utilities

of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. KIAA1817 (Accession XM_042978) is another VGAM958 host target gene. KIAA1817 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1817 BINDING SITE, designated SEQ ID:33864, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35972] Another function of VGAM958 is therefore inhibition of KIAA1817 (Accession XM_042978). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1817. MGC3265 (Accession NM_024028) is another VGAM958 host target gene. MGC3265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3265

BINDING SITE, designated SEQ ID:23458, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35973] Another function of VGAM958 is therefore inhibition of MGC3265 (Accession NM_024028). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3265. MAP Kinase–interacting Serine/threonine Kinase 1 (MKNK1, Accession NM_003684) is another VGAM958 host target gene. MKNK1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MKNK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKNK1 BINDING SITE, designated SEQ ID:9795, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35974] Another function of VGAM958 is therefore inhibition of MAP Kinase–interacting Serine/threonine Kinase 1 (MKNK1, Accession NM_003684). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKNK1.

PRO2955 (Accession NM_018545) is another VGAM958 host target gene. PRO2955 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2955 BINDING SITE, designated SEQ ID:20623, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35975] Another function of VGAM958 is therefore inhibition of PRO2955 (Accession NM_018545). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2955. Proline-serine-threonine Phosphatase Interacting Protein 2 (PSTPIP2, Accession NM_024430) is another VGAM958 host target gene. PSTPIP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSTPIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSTPIP2 BINDING SITE, designated SEQ ID:23684, to the nucleotide sequence of

VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35976] Another function of VGAM958 is therefore inhibition of Proline-serine-threonine Phosphatase Interacting Protein 2 (PSTPIP2, Accession NM_024430). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSTPIP2. SIMRP7 (Accession XM_166462) is another VGAM958 host target gene. SIMRP7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIMRP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIMRP7 BINDING SITE, designated SEQ ID:44375, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35977] Another function of VGAM958 is therefore inhibition of SIMRP7 (Accession XM_166462). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIMRP7. SS-56 (Accession XM_006063) is another VGAM958 host target gene. SS-56 BINDING SITE is HOST TARGET binding

site found in the 5' untranslated region of mRNA encoded by SS-56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS-56 BINDING SITE, designated SEQ ID:29991, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35978] Another function of VGAM958 is therefore inhibition of SS-56 (Accession XM_006063). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS-56. WAC (Accession NM_100264) is another VGAM958 host target gene. WAC BINDING SITE1 through WAC BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WAC, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WAC BINDING SITE1 through WAC BINDING SITE3, designated SEQ ID:28157, SEQ ID:28158 and SEQ ID:18743 respectively, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35979] Another function of VGAM958 is therefore inhibition of WAC (Accession NM_100264). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WAC. LOC115073 (Accession XM_055193) is another VGAM958 host target gene. LOC115073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115073 BINDING SITE, designated SEQ ID:36240, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35980] Another function of VGAM958 is therefore inhibition of LOC115073 (Accession XM_055193). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115073. LOC124460 (Accession XM_071892) is another VGAM958 host target gene. LOC124460 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124460, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124460 BINDING SITE, designated SEQ ID:37447, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35981] Another function of VGAM958 is therefore inhibition of LOC124460 (Accession XM_071892). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124460. LOC125929 (Accession XM_064872) is another VGAM958 host target gene. LOC125929 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC125929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125929 BINDING SITE, designated SEQ ID:37268, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35982] Another function of VGAM958 is therefore inhibition of LOC125929 (Accession XM_064872). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC125929. LOC129011 (Accession XM_059326) is another VGAM958 host target gene. LOC129011 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129011 BINDING SITE, designated SEQ ID:36967, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35983] Another function of VGAM958 is therefore inhibition of LOC129011 (Accession XM_059326). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129011. LOC129138 (Accession NM_138797) is another VGAM958 host target gene. LOC129138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129138 BINDING SITE, designated SEQ ID:29019, to the nucleotide sequence of VGAM958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3669.

[35984] Another function of VGAM958 is therefore inhibition of LOC129138 (Accession NM_138797). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129138. LOC144308 (Accession XM_096575) is another VGAM958 host target gene. LOC144308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144308 BINDING SITE, designated SEQ ID:40408, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35985] Another function of VGAM958 is therefore inhibition of LOC144308 (Accession XM_096575). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144308. LOC144699 (Accession XM_084940) is another VGAM958 host target gene. LOC144699 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144699, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144699 BINDING SITE, designated SEQ ID:37771, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35986] Another function of VGAM958 is therefore inhibition of LOC144699 (Accession XM_084940). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144699. LOC145508 (Accession XM_085158) is another VGAM958 host target gene. LOC145508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145508 BINDING SITE, designated SEQ ID:37887, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35987] Another function of VGAM958 is therefore inhibition of LOC145508 (Accession XM_085158). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC145508. LOC146243 (Accession XM_096956) is another VGAM958 host target gene. LOC146243 BINDING SITE1 and LOC146243 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC146243, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146243 BINDING SITE1 and LOC146243 BINDING SITE2, designated SEQ ID:40680 and SEQ ID:40681 respectively, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35988] Another function of VGAM958 is therefore inhibition of LOC146243 (Accession XM_096956). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146243. LOC147077 (Accession XM_085699) is another VGAM958 host target gene. LOC147077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC147077 BINDING SITE, designated SEQ ID:38296, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35989] Another function of VGAM958 is therefore inhibition of LOC147077 (Accession XM_085699). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147077. LOC149127 (Accession XM_097584) is another VGAM958 host target gene. LOC149127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149127 BINDING SITE, designated SEQ ID:40952, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35990] Another function of VGAM958 is therefore inhibition of LOC149127 (Accession XM_097584). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149127. LOC149271 (Accession XM_086475) is an-

other VGAM958 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38685, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35991] Another function of VGAM958 is therefore inhibition of LOC149271 (Accession XM_086475). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271. LOC152343 (Accession XM_087441) is another VGAM958 host target gene. LOC152343 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152343 BINDING SITE, designated SEQ ID:39262, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35992] Another function of VGAM958 is therefore inhibition of LOC152343 (Accession XM_087441). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152343. LOC152905 (Accession XM_017966) is another VGAM958 host target gene. LOC152905 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152905, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152905 BINDING SITE, designated SEQ ID:30332, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35993] Another function of VGAM958 is therefore inhibition of LOC152905 (Accession XM_017966). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152905. LOC153232 (Accession XM_098331) is another VGAM958 host target gene. LOC153232 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153232, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153232 BINDING SITE, designated SEQ ID:41599, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35994] Another function of VGAM958 is therefore inhibition of LOC153232 (Accession XM_098331). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153232. LOC157657 (Accession XM_088352) is another VGAM958 host target gene. LOC157657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157657 BINDING SITE, designated SEQ ID:39628, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35995] Another function of VGAM958 is therefore inhibition of LOC157657 (Accession XM_088352). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157657. LOC157737 (Accession XM_098819) is another VGAM958 host target gene. LOC157737 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157737 BINDING SITE, designated SEQ ID:41844, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35996] Another function of VGAM958 is therefore inhibition of LOC157737 (Accession XM_098819). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157737. LOC158230 (Accession XM_088517) is another VGAM958 host target gene. LOC158230 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158230, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158230 BINDING SITE, designated SEQ ID:39768, to the nucleotide sequence of VGAM958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3669.

[35997] Another function of VGAM958 is therefore inhibition of LOC158230 (Accession XM_088517). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158230. LOC165693 (Accession XM_093373) is another VGAM958 host target gene. LOC165693 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165693 BINDING SITE, designated SEQ ID:40189, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35998] Another function of VGAM958 is therefore inhibition of LOC165693 (Accession XM_093373). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165693. LOC169026 (Accession XM_095471) is another VGAM958 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169026, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40270, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[35999] Another function of VGAM958 is therefore inhibition of LOC169026 (Accession XM_095471). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. LOC196074 (Accession XM_113647) is another VGAM958 host target gene. LOC196074 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196074 BINDING SITE, designated SEQ ID:42323, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36000] Another function of VGAM958 is therefore inhibition of LOC196074 (Accession XM_113647). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC196074. LOC200058 (Accession XM_114109) is another VGAM958 host target gene. LOC200058 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200058 BINDING SITE, designated SEQ ID:42703, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36001] Another function of VGAM958 is therefore inhibition of LOC200058 (Accession XM_114109). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200058. LOC202152 (Accession XM_114446) is another VGAM958 host target gene. LOC202152 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202152 BINDING SITE, designated SEQ ID:42966, to

the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36002] Another function of VGAM958 is therefore inhibition of LOC202152 (Accession XM_114446). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202152. LOC220522 (Accession XM_018306) is another VGAM958 host target gene. LOC220522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220522 BINDING SITE, designated SEQ ID:30355, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36003] Another function of VGAM958 is therefore inhibition of LOC220522 (Accession XM_018306). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220522. LOC220753 (Accession XM_167549) is another VGAM958 host target gene. LOC220753 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC220753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220753 BINDING SITE, designated SEQ ID:44664, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36004] Another function of VGAM958 is therefore inhibition of LOC220753 (Accession XM_167549). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220753. LOC253258 (Accession XM_172870) is another VGAM958 host target gene. LOC253258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253258 BINDING SITE, designated SEQ ID:46149, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36005] Another function of VGAM958 is therefore inhibition of LOC253258 (Accession XM_172870). Accordingly, utilities

of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253258. LOC253612 (Accession XM_172985) is another VGAM958 host target gene. LOC253612 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253612 BINDING SITE, designated SEQ ID:46258, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36006] Another function of VGAM958 is therefore inhibition of LOC253612 (Accession XM_172985). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253612. LOC255057 (Accession XM_170903) is another VGAM958 host target gene. LOC255057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC255057 BINDING SITE, designated SEQ ID:45663, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36007] Another function of VGAM958 is therefore inhibition of LOC255057 (Accession XM_170903). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255057. LOC257482 (Accession XM_168544) is another VGAM958 host target gene. LOC257482 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257482 BINDING SITE, designated SEQ ID:45237, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36008] Another function of VGAM958 is therefore inhibition of LOC257482 (Accession XM_168544). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257482. LOC90494 (Accession XM_032161) is another VGAM958 host target gene. LOC90494 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90494 BINDING SITE, designated SEQ ID:31578, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36009] Another function of VGAM958 is therefore inhibition of LOC90494 (Accession XM_032161). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90494. LOC92405 (Accession XM_044914) is another VGAM958 host target gene. LOC92405 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92405 BINDING SITE, designated SEQ ID:34305, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36010] Another function of VGAM958 is therefore inhibition of

LOC92405 (Accession XM_044914). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92405. LOC92578 (Accession XM_045900) is another VGAM958 host target gene. LOC92578 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92578, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92578 BINDING SITE, designated SEQ ID:34608, to the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, also designated SEQ ID:3669.

[36011] Another function of VGAM958 is therefore inhibition of LOC92578 (Accession XM_045900). Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92578. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 959 (VGAM959) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[36012] VGAM959 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM959 was detected is described hereinabove with reference to Figs. 1–8.

[36013] VGAM959 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy Skin Disease Virus. VGAM959 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36014] VGAM959 gene encodes a VGAM959 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM959 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM959 precursor RNA is designated SEQ ID:945, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:945 is located at position 24838 relative to the genome of Lumpy Skin Disease Virus.

[36015] VGAM959 precursor RNA folds onto itself, forming VGAM959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[36016] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM959 folded precursor RNA into VGAM959 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 59%) nucleotide se-
quence of VGAM959 RNA is designated SEQ ID:3670, and
is provided hereinbelow with reference to the sequence
listing part.

[36017] VGAM959 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM959 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM959 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[36018] VGAM959 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM959 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM959 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM959 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM959 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[36019] The complementary binding of VGAM959 RNA, herein designated VGAM RNA, to host target binding sites on VGAM959 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM959 host target RNA into VGAM959 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36020] It is appreciated that VGAM959 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM959 host target genes. The mRNA of each one of this plurality of VGAM959 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM959 RNA, herein designated VGAM RNA, and which when bound by VGAM959 RNA causes inhibition of translation of respective one or more VGAM959 host target proteins.

[36021] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM959 gene, herein designated VGAM GENE, on one or

more VGAM959 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36022] It is yet further appreciated that a function of VGAM959 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM959 include diagnosis, prevention and treatment of viral infection by Lumpy Skin Disease Virus. Specific functions, and accordingly utilities, of VGAM959 correlate with, and may be deduced from, the identity of the host target genes which VGAM959 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [36023] Nucleotide sequences of the VGAM959 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM959 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM959 are further described hereinbelow with reference to Table 1.
- [36024] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM959 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM959 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [36025] As mentioned hereinabove with reference to Fig. 1, a function of VGAM959 gene, herein designated VGAM is inhibition of expression of VGAM959 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM959 correlate with, and may be deduced from, the identity of the target genes which VGAM959 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [36026] High-mobility Group Nucleosome Binding Domain 1

(HMGN1, Accession NM_004965) is a VGAM959 host target gene. HMGN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGN1 BINDING SITE, designated SEQ ID:11411, to the nucleotide sequence of VGAM959 RNA, herein designated VGAM RNA, also designated SEQ ID:3670.

[36027] A function of VGAM959 is therefore inhibition of High-mobility Group Nucleosome Binding Domain 1 (HMGN1, Accession NM_004965), a gene which binds to the inner side of the nucleosomal DNA and involves in transcriptional regulation. Accordingly, utilities of VGAM959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGN1. The function of HMGN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.PIG8 (Accession NM_004879) is another VGAM959 host target gene. PIG8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by PIG8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIG8 BINDING SITE, designated SEQ ID:11314, to the nucleotide sequence of VGAM959 RNA, herein designated VGAM RNA, also designated SEQ ID:3670.

[36028] Another function of VGAM959 is therefore inhibition of PIG8 (Accession NM_004879), a gene which is induced by p53 and may be involved in apoptosis. Accordingly, utilities of VGAM959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIG8. The function of PIG8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM737. KIAA1095 (Accession XM_041363) is another VGAM959 host target gene. KIAA1095 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1095 BINDING SITE, designated SEQ ID:33504, to the

nucleotide sequence of VGAM959 RNA, herein designated VGAM RNA, also designated SEQ ID:3670.

[36029] Another function of VGAM959 is therefore inhibition of KIAA1095 (Accession XM_041363). Accordingly, utilities of VGAM959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1095. LOC145854 (Accession XM_085259) is another VGAM959 host target gene. LOC145854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145854 BINDING SITE, designated SEQ ID:38004, to the nucleotide sequence of VGAM959 RNA, herein designated VGAM RNA, also designated SEQ ID:3670.

[36030] Another function of VGAM959 is therefore inhibition of LOC145854 (Accession XM_085259). Accordingly, utilities of VGAM959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145854. LOC158956 (Accession XM_039450) is another VGAM959 host target gene. LOC158956 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC158956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158956 BINDING SITE, designated SEQ ID:33095, to the nucleotide sequence of VGAM959 RNA, herein designated VGAM RNA, also designated SEQ ID:3670.

[36031] Another function of VGAM959 is therefore inhibition of LOC158956 (Accession XM_039450). Accordingly, utilities of VGAM959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158956. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 960 (VGAM960) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36032] VGAM960 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM960 was detected is described hereinabove with reference to Figs. 1–8.

[36033] VGAM960 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Lumpy Skin Disease Virus. VGAM960 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36034] VGAM960 gene encodes a VGAM960 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM960 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM960 precursor RNA is designated SEQ ID:946, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:946 is located at position 28243 relative to the genome of Lumpy Skin Disease Virus.

[36035] VGAM960 precursor RNA folds onto itself, forming VGAM960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36036] An enzyme complex designated DICER COMPLEX, `dices` the VGAM960 folded precursor RNA into VGAM960 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM960 RNA is designated SEQ ID:3671, and is provided hereinbelow with reference to the sequence listing part.

[36037] VGAM960 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM960 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM960 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36038] VGAM960 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM960 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM960 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM960 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM960 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36039] The complementary binding of VGAM960 RNA, herein designated VGAM RNA, to host target binding sites on VGAM960 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM960 host tar-

get RNA into VGAM960 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36040] It is appreciated that VGAM960 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM960 host target genes. The mRNA of each one of this plurality of VGAM960 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM960 RNA, herein designated VGAM RNA, and which when bound by VGAM960 RNA causes inhibition of translation of respective one or more VGAM960 host target proteins.

[36041] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM960 gene, herein designated VGAM GENE, on one or more VGAM960 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36042] It is yet further appreciated that a function of VGAM960 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM960 include diagnosis, prevention and treatment of viral infection by Lumpy Skin Disease Virus. Specific functions, and accordingly utilities, of VGAM960 correlate with, and may be deduced from, the identity of the host target genes which VGAM960 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36043] Nucleotide sequences of the VGAM960 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM960 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM960 are further

described hereinbelow with reference to Table 1.

[36044] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM960 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM960 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36045] As mentioned hereinabove with reference to Fig. 1, a function of VGAM960 gene, herein designated VGAM is inhibition of expression of VGAM960 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM960 correlate with, and may be deduced from, the identity of the target genes which VGAM960 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36046] Asparaginyl-tRNA Synthetase (NARS, Accession NM_004539) is a VGAM960 host target gene. NARS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NARS

BINDING SITE, designated SEQ ID:10890, to the nucleotide sequence of VGAM960 RNA, herein designated VGAM RNA, also designated SEQ ID:3671.

[36047] A function of VGAM960 is therefore inhibition of Asparaginyl-tRNA Synthetase (NARS, Accession NM_004539), a gene which is ASPARAGINYL-tRNA SYNTHETASE. Accordingly, utilities of VGAM960 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NARS. The function of NARS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM601. Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM_006517) is another VGAM960 host target gene. SLC16A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC16A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A2 BINDING SITE, designated SEQ ID:13272, to the nucleotide sequence of VGAM960 RNA, herein designated VGAM RNA, also designated SEQ

ID:3671.

[36048] Another function of VGAM960 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM_006517). Accordingly, utilities of VGAM960 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A2.

KIAA0391 (Accession NM_014672) is another VGAM960 host target gene. KIAA0391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:16137, to the nucleotide sequence of VGAM960 RNA, herein designated VGAM RNA, also designated SEQ ID:3671.

[36049] Another function of VGAM960 is therefore inhibition of KIAA0391 (Accession NM_014672). Accordingly, utilities of VGAM960 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 961 (VGAM961) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36050] VGAM961 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM961 was detected is described hereinabove with reference to Figs. 1–8.

[36051] VGAM961 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM961 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36052] VGAM961 gene encodes a VGAM961 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM961 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM961 precursor RNA is designated SEQ ID:947, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:947 is located at position 23299 relative to the genome of Goat–

pox Virus.

[36053] VGAM961 precursor RNA folds onto itself, forming VGAM961 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36054] An enzyme complex designated DICER COMPLEX, `dices` the VGAM961 folded precursor RNA into VGAM961 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM961 RNA is designated SEQ ID:3672, and is provided hereinbelow with reference to the sequence listing part.

[36055] VGAM961 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM961 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM961 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36056] VGAM961 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM961 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM961 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM961 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM961 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36057] The complementary binding of VGAM961 RNA, herein designated VGAM RNA, to host target binding sites on VGAM961 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM961 host target RNA into VGAM961 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36058] It is appreciated that VGAM961 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM961 host target genes. The mRNA of each one of this plurality of VGAM961 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM961 RNA, herein designated VGAM RNA, and which when bound by VGAM961 RNA causes inhibition of translation of respective one or more VGAM961 host target proteins.

[36059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM961 gene, herein designated VGAM GENE, on one or more VGAM961 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36060] It is yet further appreciated that a function of VGAM961 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM961 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM961 correlate

with, and may be deduced from, the identity of the host target genes which VGAM961 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36061] Nucleotide sequences of the VGAM961 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM961 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM961 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM961 are further described hereinbelow with reference to Table 1.

[36062] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM961 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM961 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36063] As mentioned hereinabove with reference to Fig. 1, a function of VGAM961 gene, herein designated VGAM is inhibition of expression of VGAM961 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM961 correlate with, and may be deduced

from, the identity of the target genes which VGAM961 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36064] Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858) is a VGAM961 host target gene. COL19A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:7596, to the nucleotide sequence of VGAM961 RNA, herein designated VGAM RNA, also designated SEQ ID:3672.

[36065] A function of VGAM961 is therefore inhibition of Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858), a gene which may act as a cross-bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of VGAM961 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1. The function of COL19A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM19. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 962 (VGAM962) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36066] VGAM962 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM962 was detected is described hereinabove with reference to Figs. 1–8.

[36067] VGAM962 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM962 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36068] VGAM962 gene encodes a VGAM962 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM962 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM962 precursor RNA is designated SEQ ID:948, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:948 is located at position 22678 relative to the genome of Meleagrid Herpesvirus 1.

[36069] VGAM962 precursor RNA folds onto itself, forming VGAM962 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36070] An enzyme complex designated DICER COMPLEX, `dices` the VGAM962 folded precursor RNA into VGAM962 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM962 RNA is designated SEQ ID:3673, and is provided hereinbelow with reference to the sequence listing part.

[36071] VGAM962 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM962 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM962 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36072] VGAM962 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM962 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM962 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM962 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM962 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36073] The complementary binding of VGAM962 RNA, herein designated VGAM RNA, to host target binding sites on VGAM962 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM962 host target RNA into VGAM962 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36074] It is appreciated that VGAM962 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM962 host target genes. The mRNA of each one of this plurality of VGAM962 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM962 RNA, herein designated VGAM RNA, and which when bound by VGAM962 RNA causes in-

hibition of translation of respective one or more VGAM962 host target proteins.

[36075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM962 gene, herein designated VGAM GENE, on one or more VGAM962 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36076] It is yet further appreciated that a function of VGAM962 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM962 include diagnosis, prevention and

treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM962 correlate with, and may be deduced from, the identity of the host target genes which VGAM962 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36077] Nucleotide sequences of the VGAM962 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM962 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM962 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM962 are further described hereinbelow with reference to Table 1.

[36078] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM962 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM962 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36079] As mentioned hereinabove with reference to Fig. 1, a function of VGAM962 gene, herein designated VGAM is inhibition of expression of VGAM962 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM962 correlate with, and may be deduced from, the identity of the target genes which VGAM962 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36080] Adenylate Cyclase 7 (ADCY7, Accession NM_001114) is a VGAM962 host target gene. ADCY7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY7 BINDING SITE, designated SEQ ID:6778, to the nucleotide sequence of VGAM962 RNA, herein designated VGAM RNA, also designated SEQ ID:3673.

[36081] A function of VGAM962 is therefore inhibition of Adenylate Cyclase 7 (ADCY7, Accession NM_001114), a gene which this is a membrane-bound, Ca^{2+} -inhibitable adenylyl cyclase. Accordingly, utilities of VGAM962 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY7. The function of ADCY7 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM108. Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444) is another VGAM962 host target gene. CHRAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:18901, to the nucleotide sequence of VGAM962 RNA, herein designated VGAM RNA, also designated SEQ ID:3673.

[36082] Another function of VGAM962 is therefore inhibition of Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444). Accordingly, utilities of VGAM962 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1. KIAA1538 (Accession XM_049474) is another VGAM962 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35421, to the nucleotide sequence of VGAM962 RNA, herein designated VGAM RNA, also designated SEQ ID:3673.

[36083] Another function of VGAM962 is therefore inhibition of KIAA1538 (Accession XM_049474). Accordingly, utilities of VGAM962 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. MGC2752 (Accession XM_085842) is another VGAM962 host target gene. MGC2752 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2752 BINDING SITE, designated SEQ ID:38366, to the nucleotide sequence of VGAM962 RNA, herein designated VGAM RNA, also designated SEQ ID:3673.

[36084] Another function of VGAM962 is therefore inhibition of MGC2752 (Accession XM_085842). Accordingly, utilities of VGAM962 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2752. LOC146445 (Accession XM_096999) is another

VGAM962 host target gene. LOC146445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146445 BINDING SITE, designated SEQ ID:40697, to the nucleotide sequence of VGAM962 RNA, herein designated VGAM RNA, also designated SEQ ID:3673.

[36085] Another function of VGAM962 is therefore inhibition of LOC146445 (Accession XM_096999). Accordingly, utilities of VGAM962 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146445. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 963 (VGAM963) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36086] VGAM963 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM963 was detected is described

hereinabove with reference to Figs. 1–8.

[36087] VGAM963 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM963 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36088] VGAM963 gene encodes a VGAM963 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM963 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM963 precursor RNA is designated SEQ ID:949, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:949 is located at position 20617 relative to the genome of Meleagrid Herpesvirus 1.

[36089] VGAM963 precursor RNA folds onto itself, forming VGAM963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36090] An enzyme complex designated DICER COMPLEX, `dices` the VGAM963 folded precursor RNA into VGAM963 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM963 RNA is designated SEQ ID:3674, and is provided hereinbelow with reference to the sequence listing part.

[36091] VGAM963 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM963 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM963 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36092] VGAM963 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM963 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM963 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM963 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM963 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36093] The complementary binding of VGAM963 RNA, herein designated VGAM RNA, to host target binding sites on VGAM963 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM963 host target RNA into VGAM963 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36094] It is appreciated that VGAM963 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM963 host target genes. The mRNA of each one of this plurality of VGAM963 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM963 RNA, herein designated VGAM RNA, and which when bound by VGAM963 RNA causes inhibition of translation of respective one or more VGAM963 host target proteins.

[36095] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM963 gene, herein designated VGAM GENE, on one or more VGAM963 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36096] It is yet further appreciated that a function of VGAM963 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM963 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM963 correlate with, and may be deduced from, the identity of the host target genes which VGAM963 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36097] Nucleotide sequences of the VGAM963 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM963 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM963 are further described hereinbelow with reference to Table 1.

[36098] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM963 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM963 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36099] As mentioned hereinabove with reference to Fig. 1, a function of VGAM963 gene, herein designated VGAM is inhibition of expression of VGAM963 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM963 correlate with, and may be deduced from, the identity of the target genes which VGAM963 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36100] EZFIT (Accession NM_021216) is a VGAM963 host target gene. EZFIT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EZFIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of EZFIT BINDING SITE, designated SEQ ID:22197, to the nucleotide sequence of VGAM963 RNA, herein designated VGAM RNA, also designated SEQ ID:3674.

[36101] A function of VGAM963 is therefore inhibition of EZFIT (Accession NM_021216). Accordingly, utilities of VGAM963 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EZFIT. KIAA0009 (Accession NM_014637) is another VGAM963 host target gene. KIAA0009 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0009 BINDING SITE, designated SEQ ID:16024, to the nucleotide sequence of VGAM963 RNA, herein designated VGAM RNA, also designated SEQ ID:3674.

[36102] Another function of VGAM963 is therefore inhibition of KIAA0009 (Accession NM_014637). Accordingly, utilities of VGAM963 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0009. Ubinuclein 1 (UBN1, Accession NM_016936) is

another VGAM963 host target gene. UBN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBN1 BINDING SITE, designated SEQ ID:18853, to the nucleotide sequence of VGAM963 RNA, herein designated VGAM RNA, also designated SEQ ID:3674.

[36103] Another function of VGAM963 is therefore inhibition of Ubinuclein 1 (UBN1, Accession NM_016936). Accordingly, utilities of VGAM963 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBN1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 964 (VGAM964) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36104] VGAM964 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM964 was detected is described

hereinabove with reference to Figs. 1–8.

[36105] VGAM964 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM964 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36106] VGAM964 gene encodes a VGAM964 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM964 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM964 precursor RNA is designated SEQ ID:950, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:950 is located at position 22865 relative to the genome of Meleagrid Herpesvirus 1.

[36107] VGAM964 precursor RNA folds onto itself, forming VGAM964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36108] An enzyme complex designated DICER COMPLEX, `dices` the VGAM964 folded precursor RNA into VGAM964 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM964 RNA is designated SEQ ID:3675, and is provided hereinbelow with reference to the sequence listing part.

[36109] VGAM964 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM964 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM964 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36110] VGAM964 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM964 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM964 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM964 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM964 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36111] The complementary binding of VGAM964 RNA, herein designated VGAM RNA, to host target binding sites on VGAM964 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM964 host target RNA into VGAM964 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36112] It is appreciated that VGAM964 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM964 host target genes. The mRNA of each one of this plurality of VGAM964 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM964 RNA, herein designated VGAM RNA, and which when bound by VGAM964 RNA causes inhibition of translation of respective one or more VGAM964 host target proteins.

[36113] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM964 gene, herein designated VGAM GENE, on one or more VGAM964 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36114] It is yet further appreciated that a function of VGAM964 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM964 correlate with, and may be deduced from, the identity of the host target genes which VGAM964 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36115] Nucleotide sequences of the VGAM964 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM964 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM964 are further described hereinbelow with reference to Table 1.

[36116] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM964 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM964 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36117] As mentioned hereinabove with reference to Fig. 1, a function of VGAM964 gene, herein designated VGAM is inhibition of expression of VGAM964 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM964 correlate with, and may be deduced from, the identity of the target genes which VGAM964 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36118] Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM_007332) is a VGAM964 host target gene. ANKTM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKTM1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKTM1 BINDING SITE, designated SEQ ID:14257, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36119] A function of VGAM964 is therefore inhibition of Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM_007332), a gene which attaches integral membrane proteins to cytoskeletal elements. Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKTM1. The function of ANKTM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM644. Checkpoint Suppressor 1 (CHES1, Accession NM_005197) is another VGAM964 host target gene. CHES1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHES1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHES1 BINDING SITE, designated SEQ

ID:11696, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36120] Another function of VGAM964 is therefore inhibition of Checkpoint Suppressor 1 (CHES1, Accession NM_005197). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHES1. Deoxyguanosine Kinase (DGUOK, Accession NM_080915) is another VGAM964 host target gene. DGUOK BINDING SITE1 and DGUOK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DGUOK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGUOK BINDING SITE1 and DGUOK BINDING SITE2, designated SEQ ID:28136 and SEQ ID:28139 respectively, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36121] Another function of VGAM964 is therefore inhibition of Deoxyguanosine Kinase (DGUOK, Accession NM_080915), a gene which is deoxyguanosine kinase and mediates phosphorylation of several deoxyribonucleosides. Accord-

ingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGUOK. The function of DGUOK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM121. Zinc Finger Protein 202 (ZNF202, Accession NM_003455) is another VGAM964 host target gene. ZNF202 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF202 BINDING SITE, designated SEQ ID:9508, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36122] Another function of VGAM964 is therefore inhibition of Zinc Finger Protein 202 (ZNF202, Accession NM_003455). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF202. Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM_024331) is another VGAM964 host target gene. C20orf121 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf121 BINDING SITE, designated SEQ ID:23632, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36123] Another function of VGAM964 is therefore inhibition of Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM_024331). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf121.

FLJ14213 (Accession NM_024841) is another VGAM964 host target gene. FLJ14213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14213 BINDING SITE, designated SEQ ID:24254, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36124] Another function of VGAM964 is therefore inhibition of FLJ14213 (Accession NM_024841). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14213. FLJ22794 (Accession XM_166220) is another VGAM964 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44030, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36125] Another function of VGAM964 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM_006625) is another VGAM964 host target gene. FUSIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FUSIP1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUSIP1 BINDING SITE, designated SEQ ID:13409, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36126] Another function of VGAM964 is therefore inhibition of FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM_006625). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUSIP1. HCA4 (Accession XM_085287) is another VGAM964 host target gene. HCA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38018, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36127] Another function of VGAM964 is therefore inhibition of HCA4 (Accession XM_085287). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HCA4.

KIAA0157 (Accession NM_032182) is another VGAM964 host target gene. KIAA0157 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0157 BINDING SITE, designated SEQ ID:25899, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36128] Another function of VGAM964 is therefore inhibition of KIAA0157 (Accession NM_032182). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0157. KIAA0310 (Accession XM_088459) is another VGAM964 host target gene. KIAA0310 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0310 BINDING SITE, designated SEQ ID:39710, to the

nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36129] Another function of VGAM964 is therefore inhibition of KIAA0310 (Accession XM_088459). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0310. KIAA0884 (Accession XM_046660) is another VGAM964 host target gene. KIAA0884 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0884 BINDING SITE, designated SEQ ID:34772, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36130] Another function of VGAM964 is therefore inhibition of KIAA0884 (Accession XM_046660). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0884. KIAA1077 (Accession XM_053496) is another VGAM964 host target gene. KIAA1077 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by KIAA1077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1077 BINDING SITE, designated SEQ ID:36095, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36131] Another function of VGAM964 is therefore inhibition of KIAA1077 (Accession XM_053496). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1077. KIAA1948 (Accession XM_091984) is another VGAM964 host target gene. KIAA1948 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1948 BINDING SITE, designated SEQ ID:40076, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36132] Another function of VGAM964 is therefore inhibition of KIAA1948 (Accession XM_091984). Accordingly, utilities

of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1948. LOC151556 (Accession XM_087239) is another VGAM964 host target gene. LOC151556 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151556 BINDING SITE, designated SEQ ID:39133, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36133] Another function of VGAM964 is therefore inhibition of LOC151556 (Accession XM_087239). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151556. LOC256946 (Accession XM_170543) is another VGAM964 host target gene. LOC256946 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256946 BINDING SITE, designated SEQ ID:45359, to the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, also designated SEQ ID:3675.

[36134] Another function of VGAM964 is therefore inhibition of LOC256946 (Accession XM_170543). Accordingly, utilities of VGAM964 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256946. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 965 (VGAM965) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36135] VGAM965 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM965 was detected is described hereinabove with reference to Figs. 1–8.

[36136] VGAM965 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM965 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36137] VGAM965 gene encodes a VGAM965 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM965 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM965 precursor RNA is designated SEQ ID:951, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:951 is located at position 23173 relative to the genome of Meleagrid Herpesvirus 1.

[36138] VGAM965 precursor RNA folds onto itself, forming VGAM965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36139] An enzyme complex designated DICER COMPLEX, `dices` the VGAM965 folded precursor RNA into VGAM965 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM965 RNA is designated SEQ ID:3676, and is provided hereinbelow with reference to the sequence listing part.

[36140] VGAM965 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM965 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM965 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36141] VGAM965 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM965 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM965 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM965 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM965 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[36142] The complementary binding of VGAM965 RNA, herein designated VGAM RNA, to host target binding sites on VGAM965 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM965 host target RNA into VGAM965 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36143] It is appreciated that VGAM965 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM965 host target genes. The mRNA of each one of this plurality of VGAM965 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM965 RNA, herein designated VGAM RNA, and which when bound by VGAM965 RNA causes inhibition of translation of respective one or more VGAM965 host target proteins.

[36144] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM965 gene, herein designated VGAM GENE, on one or more VGAM965 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[36145] It is yet further appreciated that a function of VGAM965 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM965 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM965 correlate with, and may be deduced from, the identity of the host target genes which VGAM965 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36146] Nucleotide sequences of the VGAM965 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM965 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM965 are further described hereinbelow with reference to Table 1.

[36147] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM965 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM965 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36148] As mentioned hereinabove with reference to Fig. 1, a function of VGAM965 gene, herein designated VGAM is inhibition of expression of VGAM965 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM965 correlate with, and may be deduced from, the identity of the target genes which VGAM965 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36149] Holocarboxylase Synthetase
(biotin-[propionyl-Coenzyme A-carboxylase
(ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411)
is a VGAM965 host target gene. HLCS BINDING SITE is
HOST TARGET binding site found in the 3' untranslated
region of mRNA encoded by HLCS, corresponding to a
HOST TARGET binding site such as BINDING SITE I, BIND-
ING SITE II or BINDING SITE III. Table 2 illustrates the com-
plementarity of the nucleotide sequences of HLCS BIND-
ING SITE, designated SEQ ID:5990, to the nucleotide se-
quence of VGAM965 RNA, herein designated VGAM RNA,

also designated SEQ ID:3676.

[36150] A function of VGAM965 is therefore inhibition of Holocarboxylase Synthetase (biotin-[propionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411). Accordingly, utilities of VGAM965 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLCS. Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM_020456) is another VGAM965 host target gene. C13orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C13orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C13orf1 BINDING SITE, designated SEQ ID:21688, to the nucleotide sequence of VGAM965 RNA, herein designated VGAM RNA, also designated SEQ ID:3676.

[36151] Another function of VGAM965 is therefore inhibition of Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM_020456). Accordingly, utilities of VGAM965 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C13orf1. DK-FZp761B1514 (Accession NM_032288) is another

VGAM965 host target gene. DKFZp761B1514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761B1514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761B1514 BINDING SITE, designated SEQ ID:26045, to the nucleotide sequence of VGAM965 RNA, herein designated VGAM RNA, also designated SEQ ID:3676.

[36152] Another function of VGAM965 is therefore inhibition of DKFZp761B1514 (Accession NM_032288). Accordingly, utilities of VGAM965 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B1514. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 966 (VGAM966) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36153] VGAM966 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM966 was detected is described hereinabove with reference to Figs. 1–8.

[36154] VGAM966 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM966 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36155] VGAM966 gene encodes a VGAM966 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM966 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM966 precursor RNA is designated SEQ ID:952, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:952 is located at position 21558 relative to the genome of Meleagrid Herpesvirus 1.

[36156] VGAM966 precursor RNA folds onto itself, forming VGAM966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36157] An enzyme complex designated DICER COMPLEX, `dices` the VGAM966 folded precursor RNA into VGAM966 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM966 RNA is designated SEQ ID:3677, and is provided hereinbelow with reference to the sequence listing part.

[36158] VGAM966 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM966 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM966 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36159] VGAM966 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM966 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM966 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM966 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM966 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[36160] The complementary binding of VGAM966 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM966 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM966 host target RNA into VGAM966 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36161] It is appreciated that VGAM966 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM966 host target genes. The mRNA of each one of this plurality of VGAM966 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM966 RNA, herein designated VGAM RNA, and which when bound by VGAM966 RNA causes inhibition of translation of respective one or more VGAM966 host target proteins.

[36162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM966 gene, herein designated VGAM GENE, on one or more VGAM966 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36163] It is yet further appreciated that a function of VGAM966 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM966 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM966 correlate with, and may be deduced from, the identity of the host target genes which VGAM966 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36164] Nucleotide sequences of the VGAM966 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM966 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM966 are further described hereinbelow with reference to Table 1.

[36165] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM966 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM966 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36166] As mentioned hereinabove with reference to Fig. 1, a function of VGAM966 gene, herein designated VGAM is inhibition of expression of VGAM966 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM966 correlate with, and may be deduced from, the identity of the target genes which VGAM966 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36167] Erythrocyte Membrane Protein Band 4.1-like 2 (EPB41L2, Accession NM_001431) is a VGAM966 host target gene. EPB41L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

EPB41L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L2 BINDING SITE, designated SEQ ID:7154, to the nucleotide sequence of VGAM966 RNA, herein designated VGAM RNA, also designated SEQ ID:3677.

[36168] A function of VGAM966 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 2 (EPB41L2, Accession NM_001431). Accordingly, utilities of VGAM966 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L2. Retinal Degeneration, Slow (retinitis pigmentosa 7) (RDS, Accession NM_000322) is another VGAM966 host target gene. RDS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RDS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDS BINDING SITE, designated SEQ ID:5863, to the nucleotide sequence of VGAM966 RNA, herein designated VGAM RNA, also designated SEQ ID:3677.

[36169] Another function of VGAM966 is therefore inhibition of

Retinal Degeneration, Slow (retinitis pigmentosa 7) (RDS, Accession NM_000322), a gene which may function as an adhesion molecule involved in stabilization and compaction of outer segment disks or in the maintenance of the curvature of the rim. Accordingly, utilities of VGAM966 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDS. The function of RDS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.KIAA1946 (Accession XM_092459) is another VGAM966 host target gene. KIAA1946 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1946 BINDING SITE, designated SEQ ID:40118, to the nucleotide sequence of VGAM966 RNA, herein designated VGAM RNA, also designated SEQ ID:3677.

[36170] Another function of VGAM966 is therefore inhibition of KIAA1946 (Accession XM_092459). Accordingly, utilities of VGAM966 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1946. MGC3130 (Accession NM_024032) is another VGAM966 host target gene. MGC3130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3130 BINDING SITE, designated SEQ ID:23460, to the nucleotide sequence of VGAM966 RNA, herein designated VGAM RNA, also designated SEQ ID:3677.

[36171] Another function of VGAM966 is therefore inhibition of MGC3130 (Accession NM_024032). Accordingly, utilities of VGAM966 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3130. MGC4415 (Accession NM_031484) is another VGAM966 host target gene. MGC4415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4415 BINDING SITE, designated SEQ ID:25566, to the nucleotide

sequence of VGAM966 RNA, herein designated VGAM RNA, also designated SEQ ID:3677.

[36172] Another function of VGAM966 is therefore inhibition of MGC4415 (Accession NM_031484). Accordingly, utilities of VGAM966 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4415. PRO0611 (Accession NM_014076) is another VGAM966 host target gene. PRO0611 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0611 BINDING SITE, designated SEQ ID:15304, to the nucleotide sequence of VGAM966 RNA, herein designated VGAM RNA, also designated SEQ ID:3677.

[36173] Another function of VGAM966 is therefore inhibition of PRO0611 (Accession NM_014076). Accordingly, utilities of VGAM966 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0611. LOC63929 (Accession NM_022098) is another VGAM966 host target gene. LOC63929 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by LOC63929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC63929 BINDING SITE, designated SEQ ID:22639, to the nucleotide sequence of VGAM966 RNA, herein designated VGAM RNA, also designated SEQ ID:3677.

[36174] Another function of VGAM966 is therefore inhibition of LOC63929 (Accession NM_022098). Accordingly, utilities of VGAM966 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63929. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 967 (VGAM967) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36175] VGAM967 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM967 was detected is described hereinabove with reference to Figs. 1–8.

[36176] VGAM967 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Sheeppox Virus.

VGAM967 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36177] VGAM967 gene encodes a VGAM967 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM967 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM967 precursor RNA is designated SEQ ID:953, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:953 is located at position 26912 relative to the genome of Sheeppox Virus.

[36178] VGAM967 precursor RNA folds onto itself, forming VGAM967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36179] An enzyme complex designated DICER COMPLEX, `dices` the VGAM967 folded precursor RNA into VGAM967 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM967 RNA is designated SEQ ID:3678, and is provided hereinbelow with reference to the sequence listing part.

[36180] VGAM967 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM967 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM967 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36181] VGAM967 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM967 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM967 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM967 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM967 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36182] The complementary binding of VGAM967 RNA, herein designated VGAM RNA, to host target binding sites on VGAM967 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM967 host tar-

get RNA into VGAM967 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36183] It is appreciated that VGAM967 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM967 host target genes. The mRNA of each one of this plurality of VGAM967 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM967 RNA, herein designated VGAM RNA, and which when bound by VGAM967 RNA causes inhibition of translation of respective one or more VGAM967 host target proteins.

[36184] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM967 gene, herein designated VGAM GENE, on one or more VGAM967 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36185] It is yet further appreciated that a function of VGAM967 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM967 include diagnosis, prevention and treatment of viral infection by Sheeppox Virus. Specific functions, and accordingly utilities, of VGAM967 correlate with, and may be deduced from, the identity of the host target genes which VGAM967 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36186] Nucleotide sequences of the VGAM967 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM967 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM967 are further

described hereinbelow with reference to Table 1.

[36187] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM967 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM967 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36188] As mentioned hereinabove with reference to Fig. 1, a function of VGAM967 gene, herein designated VGAM is inhibition of expression of VGAM967 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM967 correlate with, and may be deduced from, the identity of the target genes which VGAM967 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36189] LOC161589 (Accession XM_090991) is a VGAM967 host target gene. LOC161589 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161589 BINDING SITE,

designated SEQ ID:40023, to the nucleotide sequence of VGAM967 RNA, herein designated VGAM RNA, also designated SEQ ID:3678.

[36190] A function of VGAM967 is therefore inhibition of LOC161589 (Accession XM_090991). Accordingly, utilities of VGAM967 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161589. LOC202108 (Accession XM_114442) is another VGAM967 host target gene. LOC202108 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202108 BINDING SITE, designated SEQ ID:42965, to the nucleotide sequence of VGAM967 RNA, herein designated VGAM RNA, also designated SEQ ID:3678.

[36191] Another function of VGAM967 is therefore inhibition of LOC202108 (Accession XM_114442). Accordingly, utilities of VGAM967 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202108. LOC202333 (Accession XM_114467) is another VGAM967 host target gene. LOC202333 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202333 BINDING SITE, designated SEQ ID:42970, to the nucleotide sequence of VGAM967 RNA, herein designated VGAM RNA, also designated SEQ ID:3678.

[36192] Another function of VGAM967 is therefore inhibition of LOC202333 (Accession XM_114467). Accordingly, utilities of VGAM967 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202333. LOC221838 (Accession XM_166521) is another VGAM967 host target gene. LOC221838 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221838 BINDING SITE, designated SEQ ID:44459, to the nucleotide sequence of VGAM967 RNA, herein designated VGAM RNA, also designated SEQ ID:3678.

[36193] Another function of VGAM967 is therefore inhibition of

LOC221838 (Accession XM_166521). Accordingly, utilities of VGAM967 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221838. LOC221839 (Accession XM_166506) is another VGAM967 host target gene. LOC221839 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221839 BINDING SITE, designated SEQ ID:44430, to the nucleotide sequence of VGAM967 RNA, herein designated VGAM RNA, also designated SEQ ID:3678.

[36194] Another function of VGAM967 is therefore inhibition of LOC221839 (Accession XM_166506). Accordingly, utilities of VGAM967 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221839. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 968 (VGAM968) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[36195] VGAM968 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM968 was detected is described hereinabove with reference to Figs. 1–8.

[36196] VGAM968 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sheeppox Virus. VGAM968 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36197] VGAM968 gene encodes a VGAM968 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM968 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM968 precursor RNA is designated SEQ ID:954, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:954 is located at position 24977 relative to the genome of Sheeppox Virus.

[36198] VGAM968 precursor RNA folds onto itself, forming VGAM968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[36199] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM968 folded precursor RNA into VGAM968 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 42%) nucleotide se-
quence of VGAM968 RNA is designated SEQ ID:3679, and
is provided hereinbelow with reference to the sequence
listing part.

[36200] VGAM968 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM968 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM968 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[36201] VGAM968 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM968 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM968 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM968 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM968 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[36202] The complementary binding of VGAM968 RNA, herein designated VGAM RNA, to host target binding sites on VGAM968 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM968 host target RNA into VGAM968 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36203] It is appreciated that VGAM968 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM968 host target genes. The mRNA of each one of this plurality of VGAM968 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM968 RNA, herein designated VGAM RNA, and which when bound by VGAM968 RNA causes inhibition of translation of respective one or more VGAM968 host target proteins.

[36204] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM968 gene, herein designated VGAM GENE, on one or

more VGAM968 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36205] It is yet further appreciated that a function of VGAM968 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM968 include diagnosis, prevention and treatment of viral infection by Sheeppox Virus. Specific functions, and accordingly utilities, of VGAM968 correlate with, and may be deduced from, the identity of the host target genes which VGAM968 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [36206] Nucleotide sequences of the VGAM968 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM968 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM968 are further described hereinbelow with reference to Table 1.
- [36207] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM968 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM968 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [36208] As mentioned hereinabove with reference to Fig. 1, a function of VGAM968 gene, herein designated VGAM is inhibition of expression of VGAM968 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM968 correlate with, and may be deduced from, the identity of the target genes which VGAM968 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [36209] Mastermind-like 1 (Drosophila) (MAML1, Accession

NM_014757) is a VGAM968 host target gene. MAML1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAML1 BINDING SITE, designated SEQ ID:16496, to the nucleotide sequence of VGAM968 RNA, herein designated VGAM RNA, also designated SEQ ID:3679.

[36210] A function of VGAM968 is therefore inhibition of Mastermind-like 1 (Drosophila) (MAML1, Accession NM_014757), a gene which MAML1 functions as a transcriptional coactivator for Notch signaling. Accordingly, utilities of VGAM968 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAML1. The function of MAML1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM556.KIAA0628 (Accession NM_014789) is another VGAM968 host target gene. KIAA0628 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0628, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0628 BINDING SITE, designated SEQ ID:16673, to the nucleotide sequence of VGAM968 RNA, herein designated VGAM RNA, also designated SEQ ID:3679.

[36211] Another function of VGAM968 is therefore inhibition of KIAA0628 (Accession NM_014789). Accordingly, utilities of VGAM968 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0628. KIAA1281 (Accession XM_114432) is another VGAM968 host target gene. KIAA1281 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1281 BINDING SITE, designated SEQ ID:42963, to the nucleotide sequence of VGAM968 RNA, herein designated VGAM RNA, also designated SEQ ID:3679.

[36212] Another function of VGAM968 is therefore inhibition of KIAA1281 (Accession XM_114432). Accordingly, utilities of VGAM968 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1281. MIG (Accession NM_002416) is another VGAM968 host target gene. MIG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG BINDING SITE, designated SEQ ID:8245, to the nucleotide sequence of VGAM968 RNA, herein designated VGAM RNA, also designated SEQ ID:3679.

[36213] Another function of VGAM968 is therefore inhibition of MIG (Accession NM_002416). Accordingly, utilities of VGAM968 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG. LOC222865 (Accession XM_167242) is another VGAM968 host target gene. LOC222865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222865 BINDING SITE, designated SEQ ID:44623, to the nucleotide sequence of VGAM968 RNA, herein designated VGAM RNA,

also designated SEQ ID:3679.

[36214] Another function of VGAM968 is therefore inhibition of LOC222865 (Accession XM_167242). Accordingly, utilities of VGAM968 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222865. LOC92303 (Accession XM_044108) is another VGAM968 host target gene. LOC92303 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92303 BINDING SITE, designated SEQ ID:34134, to the nucleotide sequence of VGAM968 RNA, herein designated VGAM RNA, also designated SEQ ID:3679.

[36215] Another function of VGAM968 is therefore inhibition of LOC92303 (Accession XM_044108). Accordingly, utilities of VGAM968 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92303. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 969 (VGAM969) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36216] VGAM969 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM969 was detected is described hereinabove with reference to Figs. 1–8.

[36217] VGAM969 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus.

VGAM969 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36218] VGAM969 gene encodes a VGAM969 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM969 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM969 precursor RNA is designated SEQ ID:955, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:955 is located at position 25550 relative to the genome of Goatpox Virus.

[36219] VGAM969 precursor RNA folds onto itself, forming

VGAM969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36220] An enzyme complex designated DICER COMPLEX, `dices` the VGAM969 folded precursor RNA into VGAM969 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM969 RNA is designated SEQ ID:3680, and is provided hereinbelow with reference to the sequence listing part.

[36221] VGAM969 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM969 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM969 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36222] VGAM969 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM969 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM969 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM969 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM969 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36223] The complementary binding of VGAM969 RNA, herein designated VGAM RNA, to host target binding sites on VGAM969 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM969 host target RNA into VGAM969 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36224] It is appreciated that VGAM969 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM969 host target genes. The mRNA of each one of this plurality of VGAM969 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM969 RNA, herein designated VGAM RNA, and which when bound by VGAM969 RNA causes inhibition of translation of respective one or more VGAM969 host target proteins.

[36225] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM969 gene, herein designated VGAM GENE, on one or more VGAM969 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36226] It is yet further appreciated that a function of VGAM969 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM969 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM969 correlate with, and may be deduced from, the identity of the host target genes which VGAM969 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[36227] Nucleotide sequences of the VGAM969 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM969 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM969 are further described hereinbelow with reference to Table 1.

[36228] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM969 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM969 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36229] As mentioned hereinabove with reference to Fig. 1, a function of VGAM969 gene, herein designated VGAM is inhibition of expression of VGAM969 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM969 correlate with, and may be deduced from, the identity of the target genes which VGAM969 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[36230] KIAA0534 (Accession XM_049349) is a VGAM969 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:35375, to the nucleotide sequence of VGAM969 RNA, herein designated VGAM RNA, also designated SEQ ID:3680.

[36231] A function of VGAM969 is therefore inhibition of KIAA0534 (Accession XM_049349). Accordingly, utilities of VGAM969 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. KIAA1708 (Accession XM_040211) is another VGAM969 host target gene. KIAA1708 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1708 BINDING SITE, designated SEQ ID:33271, to the

nucleotide sequence of VGAM969 RNA, herein designated VGAM RNA, also designated SEQ ID:3680.

[36232] Another function of VGAM969 is therefore inhibition of KIAA1708 (Accession XM_040211). Accordingly, utilities of VGAM969 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1708. LOC157464 (Accession XM_098758) is another VGAM969 host target gene. LOC157464 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157464 BINDING SITE, designated SEQ ID:41796, to the nucleotide sequence of VGAM969 RNA, herein designated VGAM RNA, also designated SEQ ID:3680.

[36233] Another function of VGAM969 is therefore inhibition of LOC157464 (Accession XM_098758). Accordingly, utilities of VGAM969 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157464. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 970 (VGAM970) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36234] VGAM970 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM970 was detected is described hereinabove with reference to Figs. 1–8.

[36235] VGAM970 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sheeppox Virus. VGAM970 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36236] VGAM970 gene encodes a VGAM970 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM970 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM970 precursor RNA is designated SEQ ID:956, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:956 is located at position 23426 relative to the genome of Sheeppox Virus.

[36237] VGAM970 precursor RNA folds onto itself, forming VGAM970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36238] An enzyme complex designated DICER COMPLEX, `dices` the VGAM970 folded precursor RNA into VGAM970 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM970 RNA is designated SEQ ID:3681, and is provided hereinbelow with reference to the sequence listing part.

[36239] VGAM970 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM970 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM970 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36240] VGAM970 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM970 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM970 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM970 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM970 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36241] The complementary binding of VGAM970 RNA, herein designated VGAM RNA, to host target binding sites on VGAM970 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM970 host target RNA into VGAM970 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36242] It is appreciated that VGAM970 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM970 host target genes. The mRNA of each one of this plurality of VGAM970 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM970 RNA, herein designated VGAM RNA, and which when bound by VGAM970 RNA causes inhibition of translation of respective one or more VGAM970 host target proteins.

[36243] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM970 gene, herein designated VGAM GENE, on one or more VGAM970 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36244] It is yet further appreciated that a function of VGAM970 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM970 include diagnosis, prevention and treatment of viral infection by Sheeppox Virus. Specific functions, and accordingly utilities, of VGAM970 correlate with, and may be deduced from, the identity of the host

target genes which VGAM970 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36245] Nucleotide sequences of the VGAM970 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM970 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM970 are further described hereinbelow with reference to Table 1.

[36246] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM970 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM970 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36247] As mentioned hereinabove with reference to Fig. 1, a function of VGAM970 gene, herein designated VGAM is inhibition of expression of VGAM970 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM970 correlate with, and may be deduced from, the identity of the target genes which VGAM970

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36248] B29 (Accession NM_031939) is a VGAM970 host target gene. B29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B29 BINDING SITE, designated SEQ ID:25684, to the nucleotide sequence of VGAM970 RNA, herein designated VGAM RNA, also designated SEQ ID:3681.

[36249] A function of VGAM970 is therefore inhibition of B29 (Accession NM_031939). Accordingly, utilities of VGAM970 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B29. CD2-associated Protein (CD2AP, Accession NM_012120) is another VGAM970 host target gene. CD2AP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD2AP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD2AP BINDING SITE, designated SEQ ID:14431, to the nucleotide se-

quence of VGAM970 RNA, herein designated VGAM RNA, also designated SEQ ID:3681.

[36250] Another function of VGAM970 is therefore inhibition of CD2-associated Protein (CD2AP, Accession NM_012120), a gene which binds CAS ligand and may therefor involves in its growth regulatory pathway. Accordingly, utilities of VGAM970 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD2AP. The function of CD2AP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Mdm4, Transformed 3T3 Cell Double Minute 4, P53 Binding Protein (mouse) (MDM4, Accession NM_002393) is another VGAM970 host target gene. MDM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDM4 BINDING SITE, designated SEQ ID:8208, to the nucleotide sequence of VGAM970 RNA, herein designated VGAM RNA, also designated SEQ ID:3681.

[36251] Another function of VGAM970 is therefore inhibition of

Mdm4, Transformed 3T3 Cell Double Minute 4, P53 Binding Protein (mouse) (MDM4, Accession NM_002393), a gene which is strongly similar to murine Mdm4; may interact with p53. Accordingly, utilities of VGAM970 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDM4. The function of MDM4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM739. SERP1 (Accession NM_014445) is another VGAM970 host target gene. SERP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERP1 BINDING SITE, designated SEQ ID:15795, to the nucleotide sequence of VGAM970 RNA, herein designated VGAM RNA, also designated SEQ ID:3681.

[36252] Another function of VGAM970 is therefore inhibition of SERP1 (Accession NM_014445). Accordingly, utilities of VGAM970 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERP1.

SKI-like (SKIL, Accession NM_005414) is another VGAM970 host target gene. SKIL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SKIL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKIL BINDING SITE, designated SEQ ID:11885, to the nucleotide sequence of VGAM970 RNA, herein designated VGAM RNA, also designated SEQ ID:3681.

[36253] Another function of VGAM970 is therefore inhibition of SKI-like (SKIL, Accession NM_005414). Accordingly, utilities of VGAM970 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKIL. LOC149271 (Accession XM_086475) is another VGAM970 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38676, to the nucleotide sequence of VGAM970 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3681.

[36254] Another function of VGAM970 is therefore inhibition of LOC149271 (Accession XM_086475). Accordingly, utilities of VGAM970 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 971 (VGAM971) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36255] VGAM971 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM971 was detected is described hereinabove with reference to Figs. 1–8.

[36256] VGAM971 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM971 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36257] VGAM971 gene encodes a VGAM971 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM971 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM971 precursor RNA is designated SEQ ID:957, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:957 is located at position 53540 relative to the genome of *Melanoplus Sanguinipes* Entomopoxvirus.

[36258] VGAM971 precursor RNA folds onto itself, forming VGAM971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36259] An enzyme complex designated DICER COMPLEX, `dices` the VGAM971 folded precursor RNA into VGAM971 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM971 RNA is designated SEQ ID:3682, and is provided hereinbelow with reference to the sequence listing part.

[36260] VGAM971 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM971 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM971 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36261] VGAM971 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM971 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM971 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM971 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM971 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36262] The complementary binding of VGAM971 RNA, herein designated VGAM RNA, to host target binding sites on VGAM971 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM971 host target RNA into VGAM971 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36263] It is appreciated that VGAM971 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM971 host target genes. The mRNA of

each one of this plurality of VGAM971 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM971 RNA, herein designated VGAM RNA, and which when bound by VGAM971 RNA causes inhibition of translation of respective one or more VGAM971 host target proteins.

[36264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM971 gene, herein designated VGAM GENE, on one or more VGAM971 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[36265] It is yet further appreciated that a function of VGAM971 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM971 correlate with, and may be deduced from, the identity of the host target genes which VGAM971 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36266] Nucleotide sequences of the VGAM971 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM971 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM971 are further described hereinbelow with reference to Table 1.

[36267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM971 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM971 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[36268] As mentioned hereinabove with reference to Fig. 1, a function of VGAM971 gene, herein designated VGAM is inhibition of expression of VGAM971 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM971 correlate with, and may be deduced from, the identity of the target genes which VGAM971 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36269] Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM_080923) is a VGAM971 host target gene. PTPRC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPRC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRC BINDING SITE, designated SEQ ID:28149, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36270] A function of VGAM971 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Acces-

sion NM_080923). Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRC. Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155) is another VGAM971 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10366, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36271] Another function of VGAM971 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM60. Transcription Factor 3 (E2A immunoglobulin enhancer binding factors E12/E47) (TCF3, Accession XM_047600) is another VGAM971 host target gene. TCF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF3 BINDING SITE, designated SEQ ID:35006, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36272] Another function of VGAM971 is therefore inhibition of Transcription Factor 3 (E2A immunoglobulin enhancer binding factors E12/E47) (TCF3, Accession XM_047600), a gene which plays major roles in determining tissue-specific cell fate during embryogenesis. Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF3. The function of TCF3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM144.VAMP (vesicle-associated membrane protein)-associated Protein B and C (VAPB, Accession NM_004738) is another VGAM971 host target gene. VAPB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VAPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAPB BINDING SITE, designated SEQ ID:11132, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36273] Another function of VGAM971 is therefore inhibition of VAMP (vesicle-associated membrane protein)-associated Protein B and C (VAPB, Accession NM_004738). Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAPB. DEPP (Accession NM_007021) is another VGAM971 host target gene. DEPP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DEPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEPP BINDING SITE,

designated SEQ ID:13877, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36274] Another function of VGAM971 is therefore inhibition of DEPP (Accession NM_007021). Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEPP. DORFIN (Accession NM_015435) is another VGAM971 host target gene. DORFIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DORFIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DORFIN BINDING SITE, designated SEQ ID:17729, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36275] Another function of VGAM971 is therefore inhibition of DORFIN (Accession NM_015435). Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DORFIN. KIAA1423 (Accession XM_029703) is another VGAM971 host target gene. KIAA1423 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by KIAA1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1423 BINDING SITE, designated SEQ ID:30923, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36276] Another function of VGAM971 is therefore inhibition of KIAA1423 (Accession XM_029703). Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1423. Phospholipase C-like 2 (PLCL2, Accession XM_042836) is another VGAM971 host target gene. PLCL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLCL2 BINDING SITE, designated SEQ ID:33795, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36277] Another function of VGAM971 is therefore inhibition of

Phospholipase C-like 2 (PLCL2, Accession XM_042836). Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLCL2. Splicing Factor, Arginine/serine-rich 11 (SFRS11, Accession NM_004768) is another VGAM971 host target gene. SFRS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS11 BINDING SITE, designated SEQ ID:11158, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36278] Another function of VGAM971 is therefore inhibition of Splicing Factor, Arginine/serine-rich 11 (SFRS11, Accession NM_004768). Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS11. UBE3B (Accession XM_084941) is another VGAM971 host target gene. UBE3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE3B, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE3B BINDING SITE, designated SEQ ID:37775, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36279] Another function of VGAM971 is therefore inhibition of UBE3B (Accession XM_084941). Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3B. LOC155054 (Accession XM_088140) is another VGAM971 host target gene. LOC155054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155054 BINDING SITE, designated SEQ ID:39539, to the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, also designated SEQ ID:3682.

[36280] Another function of VGAM971 is therefore inhibition of LOC155054 (Accession XM_088140). Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC155054. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 972 (VGAM972) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36281] VGAM972 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM972 was detected is described hereinabove with reference to Figs. 1–8.

[36282] VGAM972 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM972 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36283] VGAM972 gene encodes a VGAM972 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM972 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM972 precursor RNA is designated SEQ

ID:958, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:958 is located at position 53651 relative to the genome of *Melanoplus Sanguinipes* Entomopoxvirus.

[36284] VGAM972 precursor RNA folds onto itself, forming VGAM972 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36285] An enzyme complex designated DICER COMPLEX, `dices` the VGAM972 folded precursor RNA into VGAM972 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM972 RNA is designated SEQ ID:3683, and is provided hereinbelow with reference to the sequence

listing part.

[36286] VGAM972 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM972 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM972 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36287] VGAM972 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM972 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM972 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM972 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM972 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36288] The complementary binding of VGAM972 RNA, herein designated VGAM RNA, to host target binding sites on VGAM972 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM972 host target RNA into VGAM972 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36289] It is appreciated that VGAM972 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM972 host target genes. The mRNA of each one of this plurality of VGAM972 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM972 RNA, herein designated VGAM

RNA, and which when bound by VGAM972 RNA causes inhibition of translation of respective one or more VGAM972 host target proteins.

[36290] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM972 gene, herein designated VGAM GENE, on one or more VGAM972 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36291] It is yet further appreciated that a function of VGAM972 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM972 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM972 correlate with, and may be deduced from, the identity of the host target genes which VGAM972 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36292] Nucleotide sequences of the VGAM972 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM972 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM972 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM972 are further described hereinbelow with reference to Table 1.

[36293] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM972 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM972 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36294] As mentioned hereinabove with reference to Fig. 1, a function of VGAM972 gene, herein designated VGAM is

inhibition of expression of VGAM972 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM972 correlate with, and may be deduced from, the identity of the target genes which VGAM972 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36295] Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM_005670) is a VGAM972 host target gene. EPM2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPM2A BINDING SITE, designated SEQ ID:12225, to the nucleotide sequence of VGAM972 RNA, herein designated VGAM RNA, also designated SEQ ID:3683.

[36296] A function of VGAM972 is therefore inhibition of Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM_005670), a gene which Laforin; protein tyrosine phosphatase that may have role in glycogen metabolism. Accordingly, utilities of VGAM972 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with EPM2A. The function of EPM2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM470. Kinesin-like 1 (KNSL1, Accession NM_004523) is another VGAM972 host target gene. KNSL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KNSL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KNSL1 BINDING SITE, designated SEQ ID:10863, to the nucleotide sequence of VGAM972 RNA, herein designated VGAM RNA, also designated SEQ ID:3683.

[36297] Another function of VGAM972 is therefore inhibition of Kinesin-like 1 (KNSL1, Accession NM_004523), a gene which is a motor protein required for establishing a bipolar spindle. Accordingly, utilities of VGAM972 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KNSL1. The function of KNSL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM252.BANP

(Accession XM_038696) is another VGAM972 host target gene. BANP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BANP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BANP BINDING SITE, designated SEQ ID:32910, to the nucleotide sequence of VGAM972 RNA, herein designated VGAM RNA, also designated SEQ ID:3683.

[36298] Another function of VGAM972 is therefore inhibition of BANP (Accession XM_038696). Accordingly, utilities of VGAM972 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BANP. GFR (Accession NM_012294) is another VGAM972 host target gene. GFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:14645, to the nucleotide sequence of VGAM972 RNA, herein designated VGAM RNA, also designated SEQ ID:3683.

[36299] Another function of VGAM972 is therefore inhibition of

GFR (Accession NM_012294). Accordingly, utilities of VGAM972 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. Phytoceramidase, Alkaline (PHCA, Accession NM_018367) is another VGAM972 host target gene. PHCA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHCA BINDING SITE, designated SEQ ID:20373, to the nucleotide sequence of VGAM972 RNA, herein designated VGAM RNA, also designated SEQ ID:3683.

[36300] Another function of VGAM972 is therefore inhibition of Phytoceramidase, Alkaline (PHCA, Accession NM_018367). Accordingly, utilities of VGAM972 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHCA. Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 10 (PSMD10, Accession NM_002814) is another VGAM972 host target gene. PSMD10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMD10, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMD10 BINDING SITE, designated SEQ ID:8678, to the nucleotide sequence of VGAM972 RNA, herein designated VGAM RNA, also designated SEQ ID:3683.

[36301] Another function of VGAM972 is therefore inhibition of Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 10 (PSMD10, Accession NM_002814). Accordingly, utilities of VGAM972 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMD10. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 973 (VGAM973) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36302] VGAM973 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM973 was detected is described hereinabove with reference to Figs. 1-8.

[36303] VGAM973 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine Herpesvirus 1. VGAM973 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36304] VGAM973 gene encodes a VGAM973 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM973 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM973 precursor RNA is designated SEQ ID:959, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:959 is located at position 96169 relative to the genome of Equine Herpesvirus 1.

[36305] VGAM973 precursor RNA folds onto itself, forming VGAM973 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36306] An enzyme complex designated DICER COMPLEX, `dices` the VGAM973 folded precursor RNA into VGAM973 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM973 RNA is designated SEQ ID:3684, and is provided hereinbelow with reference to the sequence listing part.

[36307] VGAM973 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM973 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM973 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36308] VGAM973 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM973 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM973 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM973 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM973 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[36309] The complementary binding of VGAM973 RNA, herein designated VGAM RNA, to host target binding sites on VGAM973 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM973 host tar-

get RNA into VGAM973 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36310] It is appreciated that VGAM973 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM973 host target genes. The mRNA of each one of this plurality of VGAM973 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM973 RNA, herein designated VGAM RNA, and which when bound by VGAM973 RNA causes inhibition of translation of respective one or more VGAM973 host target proteins.

[36311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM973 gene, herein designated VGAM GENE, on one or more VGAM973 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36312] It is yet further appreciated that a function of VGAM973 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM973 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM973 correlate with, and may be deduced from, the identity of the host target genes which VGAM973 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36313] Nucleotide sequences of the VGAM973 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM973 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM973 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM973 are further

described hereinbelow with reference to Table 1.

[36314] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM973 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM973 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36315] As mentioned hereinabove with reference to Fig. 1, a function of VGAM973 gene, herein designated VGAM is inhibition of expression of VGAM973 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM973 correlate with, and may be deduced from, the identity of the target genes which VGAM973 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36316] Myxovirus (influenza virus) Resistance 1, Interferon-inducible Protein P78 (mouse) (MX1, Accession NM_002462) is a VGAM973 host target gene. MX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MX1 BINDING SITE, designated SEQ ID:8291, to the nucleotide sequence of VGAM973 RNA, herein designated VGAM RNA, also designated SEQ ID:3684.

[36317] A function of VGAM973 is therefore inhibition of Myxovirus (influenza virus) Resistance 1, Interferon-inducible Protein P78 (mouse) (MX1, Accession NM_002462), a gene which is responsible for a specific antiviral state against influenza virus infection. Accordingly, utilities of VGAM973 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MX1. The function of MX1 has been established by previous studies. Horisberger et al. (1988) purified to homogeneity and characterized an interferon-induced human protein (p78 protein) that is the equivalent of the murine Mx1 protein as shown by antigenic relatedness, induction conditions, physicochemical properties, and amino acid analysis. The murine gene is located on chromosome 16. Horisberger et al. (1988) constructed a cDNA library using mRNAs from interferon-induced human diploid fibroblasts. They identified cDNA clones coding for the human p78 protein and used them to determine the chromosomal location of the corresponding gene, termed IFI-78K, by hybridization to

DNA from a panel of human–rodent somatic cell hybrids. The newly identified gene was located on human chromosome 21. Observation of a gene dosage effect with trisomic cells confirmed this location. The gene symbol MX, which corresponds to the mouse symbol Mx, is derived from myxovirus (influenza) resistance. Because Mx is the official title of this locus in the mouse, the same is used as the preferred symbol in man. There is a second MX gene on chromosome 21; thus, these are designated MX1 and MX2 (OMIM Ref. No. 147890). By somatic cell hybrid studies, Huber et al. (1988) likewise demonstrated that the 2 MX genes are located on distal mouse chromosome 16 and on human chromosome 21. By means of genetic linkage studies using RFLPs, Petersen et al. (1991) mapped the MX1 gene to 21q22.3 and determined its location relative to 15 other genes and DNA markers. Fanconi anemia (FA) consists of a group of at least 5 autosomal recessive disorders that share both clinical (e.g., birth defects and hematopoietic failure) and cellular (e.g., sensitivity to crosslinking agents and predisposition to apoptosis) features with each other. To identify genetic pathways that are altered in FA and to characterize shared molecular defects that might represent pathogenetic links

among these groups, Li and Youssoufian (1997) used mRNA differential display to isolate the genes that have altered expression patterns in FA cells. They reported that the expression of an interferon-inducible gene, which they referred to as MxA, is highly upregulated in cells of FA complementation groups A, B, C, and D, but that it is suppressed in FA group C cells (OMIM Ref. No. 227645) complemented with wildtype FAC cDNA, as well as in non-FA cells. A posttranslational mechanism rather than transcriptional induction appeared to account for MxA overexpression. Forced expression of MxA in Hep3B cells enhanced their sensitivity to mitomycin C and induced apoptosis, similar to the FA phenotype. Thus, MxA is a downstream target of FAC and is the first genetic marker to be identified among multiple FA complementation groups. FA subtypes may converge onto a final common pathway, which is intimately related to the interferon signaling mechanism. Constitutive activity of this pathway may explain a number of the phenotypic features of FA, particularly the pathogenesis of bone marrow failure.

[36318] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [36320] Li, Y.; Youssoufian, H. : MxA overexpression reveals a common genetic link in four Fanconi anemia complementation groups. *J. Clin. Invest.* 100: 2873–2880, 1997.
- [36321] Further studies establishing the function and utilities of MX1 are found in John Hopkins OMIM database record ID 147150, and in cited publications numbered 2019–2021, 496 and 12304 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384) is another VGAM973 host target gene. DGKD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKD BINDING SITE, designated SEQ ID:29878, to the nucleotide sequence of VGAM973 RNA, herein designated VGAM RNA, also designated SEQ ID:3684.

[36322] Another function of VGAM973 is therefore inhibition of Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384). Accordingly, utilities of VGAM973 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKD. LOC201696 (Accession XM_032269) is another VGAM973 host target gene. LOC201696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201696 BINDING SITE, designated SEQ ID:31623, to the nucleotide sequence of VGAM973 RNA, herein designated VGAM RNA, also designated SEQ ID:3684.

[36323] Another function of VGAM973 is therefore inhibition of LOC201696 (Accession XM_032269). Accordingly, utilities of VGAM973 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 974 (VGAM974) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36324] VGAM974 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM974 was detected is described hereinabove with reference to Figs. 1–8.

[36325] VGAM974 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM974 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36326] VGAM974 gene encodes a VGAM974 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM974 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM974 precursor RNA is designated SEQ ID:960, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:960 is located at position 142776 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[36327] VGAM974 precursor RNA folds onto itself, forming

VGAM974 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36328] An enzyme complex designated DICER COMPLEX, `dices` the VGAM974 folded precursor RNA into VGAM974 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM974 RNA is designated SEQ ID:3685, and is provided hereinbelow with reference to the sequence listing part.

[36329] VGAM974 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM974 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM974 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36330] VGAM974 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM974 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM974 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM974 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM974 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36331] The complementary binding of VGAM974 RNA, herein designated VGAM RNA, to host target binding sites on VGAM974 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM974 host target RNA into VGAM974 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36332] It is appreciated that VGAM974 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM974 host target genes. The mRNA of each one of this plurality of VGAM974 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM974 RNA, herein designated VGAM RNA, and which when bound by VGAM974 RNA causes inhibition of translation of respective one or more VGAM974 host target proteins.

[36333] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM974 gene, herein designated VGAM GENE, on one or more VGAM974 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36334] It is yet further appreciated that a function of VGAM974 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM974 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM974 correlate with, and may be deduced from, the identity of the host target genes which VGAM974

binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36335] Nucleotide sequences of the VGAM974 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM974 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM974 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM974 are further described hereinbelow with reference to Table 1.

[36336] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM974 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM974 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36337] As mentioned hereinabove with reference to Fig. 1, a function of VGAM974 gene, herein designated VGAM is inhibition of expression of VGAM974 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM974 correlate with, and may be deduced from, the identity of the target genes which VGAM974 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[36338] Aryl–hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM_014862) is a VGAM974 host target gene. ARNT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:16932, to the nucleotide sequence of VGAM974 RNA, herein designated VGAM RNA, also designated SEQ ID:3685.

[36339] A function of VGAM974 is therefore inhibition of Aryl–hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM_014862), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of VGAM974 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2. The function of ARNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345. Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275) is another

VGAM974 host target gene. IL1F5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1F5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F5 BINDING SITE, designated SEQ ID:14594, to the nucleotide sequence of VGAM974 RNA, herein designated VGAM RNA, also designated SEQ ID:3685.

[36340] Another function of VGAM974 is therefore inhibition of Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275), a gene which is a novel interleukin-1 receptor antagonist gene. Accordingly, utilities of VGAM974 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F5. The function of IL1F5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM263. Protein Tyrosine Phosphatase, Non-receptor Type 1 (PTPN1, Accession NM_002827) is another VGAM974 host target gene. PTPN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPN1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN1 BINDING SITE, designated SEQ ID:8702, to the nucleotide sequence of VGAM974 RNA, herein designated VGAM RNA, also designated SEQ ID:3685.

[36341] Another function of VGAM974 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 1 (PTPN1, Accession NM_002827), a gene which is a non-receptor type 1 protein tyrosine phosphatase and inhibits insulin signaling. Accordingly, utilities of VGAM974 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN1. The function of PTPN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM327. Transcription Factor 19 (SC1) (TCF19, Accession XM_175167) is another VGAM974 host target gene. TCF19 BINDING SITE1 and TCF19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCF19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of TCF19 BINDING SITE1 and TCF19 BINDING SITE2, designated SEQ ID:46656 and SEQ ID:46705 respectively, to the nucleotide sequence of VGAM974 RNA, herein designated VGAM RNA, also designated SEQ ID:3685.

[36342] Another function of VGAM974 is therefore inhibition of Transcription Factor 19 (SC1) (TCF19, Accession XM_175167), a gene which plays an important role in the transcription of genes required for the later stages of cell cycle progression. Accordingly, utilities of VGAM974 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF19. The function of TCF19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM299.KIAA0461 (Accession XM_047883) is another VGAM974 host target gene. KIAA0461 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0461 BINDING SITE, designated SEQ ID:35071, to the

nucleotide sequence of VGAM974 RNA, herein designated VGAM RNA, also designated SEQ ID:3685.

[36343] Another function of VGAM974 is therefore inhibition of KIAA0461 (Accession XM_047883). Accordingly, utilities of VGAM974 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0461. LOC200597 (Accession XM_114266) is another VGAM974 host target gene. LOC200597 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200597 BINDING SITE, designated SEQ ID:42823, to the nucleotide sequence of VGAM974 RNA, herein designated VGAM RNA, also designated SEQ ID:3685.

[36344] Another function of VGAM974 is therefore inhibition of LOC200597 (Accession XM_114266). Accordingly, utilities of VGAM974 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200597. LOC220522 (Accession XM_018306) is another VGAM974 host target gene. LOC220522 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC220522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220522 BINDING SITE, designated SEQ ID:30354, to the nucleotide sequence of VGAM974 RNA, herein designated VGAM RNA, also designated SEQ ID:3685.

[36345] Another function of VGAM974 is therefore inhibition of LOC220522 (Accession XM_018306). Accordingly, utilities of VGAM974 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220522. LOC257319 (Accession XM_171049) is another VGAM974 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:45829, to the nucleotide sequence of VGAM974 RNA, herein designated VGAM RNA, also designated SEQ ID:3685.

[36346] Another function of VGAM974 is therefore inhibition of LOC257319 (Accession XM_171049). Accordingly, utilities

of VGAM974 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257319. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 975 (VGAM975) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36347] VGAM975 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM975 was detected is described hereinabove with reference to Figs. 1–8.

[36348] VGAM975 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM975 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36349] VGAM975 gene encodes a VGAM975 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM975 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM975 precursor RNA is designated SEQ

ID:961, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:961 is located at position 34911 relative to the genome of Variola Virus.

[36350] VGAM975 precursor RNA folds onto itself, forming VGAM975 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36351] An enzyme complex designated DICER COMPLEX, `dices` the VGAM975 folded precursor RNA into VGAM975 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM975 RNA is designated SEQ ID:3686, and is provided hereinbelow with reference to the sequence

listing part.

[36352] VGAM975 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM975 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM975 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36353] VGAM975 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM975 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM975 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM975 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM975 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36354] The complementary binding of VGAM975 RNA, herein designated VGAM RNA, to host target binding sites on VGAM975 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM975 host target RNA into VGAM975 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36355] It is appreciated that VGAM975 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM975 host target genes. The mRNA of each one of this plurality of VGAM975 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM975 RNA, herein designated VGAM

RNA, and which when bound by VGAM975 RNA causes inhibition of translation of respective one or more VGAM975 host target proteins.

[36356] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM975 gene, herein designated VGAM GENE, on one or more VGAM975 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36357] It is yet further appreciated that a function of VGAM975 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM975 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM975 correlate with, and may be deduced from, the identity of the host target genes which VGAM975 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36358] Nucleotide sequences of the VGAM975 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM975 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM975 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM975 are further described hereinbelow with reference to Table 1.

[36359] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM975 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM975 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36360] As mentioned hereinabove with reference to Fig. 1, a function of VGAM975 gene, herein designated VGAM is

inhibition of expression of VGAM975 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM975 correlate with, and may be deduced from, the identity of the target genes which VGAM975 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36361] Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM_054111) is a VGAM975 host target gene. IHPK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IHPK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IHPK3 BINDING SITE, designated SEQ ID:27654, to the nucleotide sequence of VGAM975 RNA, herein designated VGAM RNA, also designated SEQ ID:3686.

[36362] A function of VGAM975 is therefore inhibition of Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM_054111). Accordingly, utilities of VGAM975 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK3. DKFZP434D193 (Accession XM_114297) is another VGAM975 host target gene. DKFZP434D193 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by DKFZP434D193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434D193 BINDING SITE, designated SEQ ID:42852, to the nucleotide sequence of VGAM975 RNA, herein designated VGAM RNA, also designated SEQ ID:3686.

[36363] Another function of VGAM975 is therefore inhibition of DKFZP434D193 (Accession XM_114297). Accordingly, utilities of VGAM975 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D193. Fucose-1-phosphate Guanylyltransferase (FPGT, Accession NM_003838) is another VGAM975 host target gene. FPGT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FPGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FPGT BINDING SITE, designated SEQ ID:9929, to the nucleotide sequence of VGAM975 RNA, herein designated VGAM RNA, also designated SEQ ID:3686.

[36364] Another function of VGAM975 is therefore inhibition of Fucose-1-phosphate Guanylyltransferase (FPGT, Accession NM_003838). Accordingly, utilities of VGAM975 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FPGT. KIAA0252 (Accession XM_031646) is another VGAM975 host target gene. KIAA0252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0252 BINDING SITE, designated SEQ ID:31449, to the nucleotide sequence of VGAM975 RNA, herein designated VGAM RNA, also designated SEQ ID:3686.

[36365] Another function of VGAM975 is therefore inhibition of KIAA0252 (Accession XM_031646). Accordingly, utilities of VGAM975 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0252. Mal, T-cell Differentiation Protein 2 (MAL2, Accession NM_052886) is another VGAM975 host target gene. MAL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

MAL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAL2 BINDING SITE, designated SEQ ID:27467, to the nucleotide sequence of VGAM975 RNA, herein designated VGAM RNA, also designated SEQ ID:3686.

[36366] Another function of VGAM975 is therefore inhibition of Mal, T-cell Differentiation Protein 2 (MAL2, Accession NM_052886). Accordingly, utilities of VGAM975 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAL2. LOC122553 (Accession XM_058630) is another VGAM975 host target gene. LOC122553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122553 BINDING SITE, designated SEQ ID:36687, to the nucleotide sequence of VGAM975 RNA, herein designated VGAM RNA, also designated SEQ ID:3686.

[36367] Another function of VGAM975 is therefore inhibition of LOC122553 (Accession XM_058630). Accordingly, utilities

of VGAM975 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122553. LOC170425 (Accession XM_084330) is another VGAM975 host target gene. LOC170425 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170425 BINDING SITE, designated SEQ ID:37548, to the nucleotide sequence of VGAM975 RNA, herein designated VGAM RNA, also designated SEQ ID:3686.

[36368] Another function of VGAM975 is therefore inhibition of LOC170425 (Accession XM_084330). Accordingly, utilities of VGAM975 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170425. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 976 (VGAM976) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36369] VGAM976 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM976 was detected is described hereinabove with reference to Figs. 1–8.

[36370] VGAM976 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM976 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36371] VGAM976 gene encodes a VGAM976 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM976 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM976 precursor RNA is designated SEQ ID:962, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:962 is located at position 48892 relative to the genome of Camelpox Virus.

[36372] VGAM976 precursor RNA folds onto itself, forming VGAM976 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36373] An enzyme complex designated DICER COMPLEX, `dices` the VGAM976 folded precursor RNA into VGAM976 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM976 RNA is designated SEQ ID:3687, and is provided hereinbelow with reference to the sequence listing part.

[36374] VGAM976 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM976 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM976 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[36375] VGAM976 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM976 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM976 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM976 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM976 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36376] The complementary binding of VGAM976 RNA, herein designated VGAM RNA, to host target binding sites on VGAM976 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM976 host target RNA into VGAM976 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36377] It is appreciated that VGAM976 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM976 host target genes. The mRNA of each one of this plurality of VGAM976 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM976 RNA, herein designated VGAM RNA, and which when bound by VGAM976 RNA causes inhibition of translation of respective one or more VGAM976 host target proteins.

[36378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM976 gene, herein designated VGAM GENE, on one or more VGAM976 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36379] It is yet further appreciated that a function of VGAM976 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM976 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM976 correlate with, and may be deduced from, the identity of the host target genes which VGAM976 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36380] Nucleotide sequences of the VGAM976 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM976 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM976 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM976 are further
described hereinbelow with reference to Table 1.

[36381] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM976 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM976 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[36382] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM976 gene, herein designated VGAM is
inhibition of expression of VGAM976 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM976 correlate with, and may be deduced
from, the identity of the target genes which VGAM976
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[36383] Fibronectin Leucine Rich Transmembrane Protein 2
(FLRT2, Accession NM_013231) is a VGAM976 host target

gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14877, to the nucleotide sequence of VGAM976 RNA, herein designated VGAM RNA, also designated SEQ ID:3687.

[36384] A function of VGAM976 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM976 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.KIAA1468 (Accession XM_166289) is another VGAM976 host target gene. KIAA1468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1468, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1468 BINDING SITE, designated SEQ ID:44097, to the nucleotide sequence of VGAM976 RNA, herein designated VGAM RNA, also designated SEQ ID:3687.

[36385] Another function of VGAM976 is therefore inhibition of KIAA1468 (Accession XM_166289). Accordingly, utilities of VGAM976 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1468. KIAA1979 (Accession XM_113984) is another VGAM976 host target gene. KIAA1979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1979 BINDING SITE, designated SEQ ID:42588, to the nucleotide sequence of VGAM976 RNA, herein designated VGAM RNA, also designated SEQ ID:3687.

[36386] Another function of VGAM976 is therefore inhibition of KIAA1979 (Accession XM_113984). Accordingly, utilities of VGAM976 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1979. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 977 (VGAM977) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36387] VGAM977 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM977 was detected is described hereinabove with reference to Figs. 1–8.

[36388] VGAM977 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM977 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36389] VGAM977 gene encodes a VGAM977 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM977 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM977 precursor RNA is designated SEQ ID:963, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:963 is

located at position 38963 relative to the genome of Vari-
ola Virus.

[36390] VGAM977 precursor RNA folds onto itself, forming VGAM977 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36391] An enzyme complex designated DICER COMPLEX, `dices` the VGAM977 folded precursor RNA into VGAM977 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM977 RNA is designated SEQ ID:3688, and is provided hereinbelow with reference to the sequence listing part.

[36392] VGAM977 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM977 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM977 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[36393] VGAM977 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM977 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM977 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM977 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM977 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36394] The complementary binding of VGAM977 RNA, herein designated VGAM RNA, to host target binding sites on VGAM977 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM977 host target RNA into VGAM977 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36395] It is appreciated that VGAM977 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM977 host target genes. The mRNA of each one of this plurality of VGAM977 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM977 RNA, herein designated VGAM RNA, and which when bound by VGAM977 RNA causes inhibition of translation of respective one or more VGAM977

host target proteins.

[36396] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM977 gene, herein designated VGAM GENE, on one or more VGAM977 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36397] It is yet further appreciated that a function of VGAM977 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM977 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific func-

tions, and accordingly utilities, of VGAM977 correlate with, and may be deduced from, the identity of the host target genes which VGAM977 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36398] Nucleotide sequences of the VGAM977 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM977 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM977 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM977 are further described hereinbelow with reference to Table 1.

[36399] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM977 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM977 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36400] As mentioned hereinabove with reference to Fig. 1, a function of VGAM977 gene, herein designated VGAM is inhibition of expression of VGAM977 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM977 correlate with, and may be deduced from, the identity of the target genes which VGAM977 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36401] HIS1 (Accession NM_006460) is a VGAM977 host target gene. HIS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIS1 BINDING SITE, designated SEQ ID:13179, to the nucleotide sequence of VGAM977 RNA, herein designated VGAM RNA, also designated SEQ ID:3688.

[36402] A function of VGAM977 is therefore inhibition of HIS1 (Accession NM_006460). Accordingly, utilities of VGAM977 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIS1. Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223) is another VGAM977 host target gene. ITPR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:7992, to the nucleotide sequence of VGAM977 RNA, herein designated VGAM RNA, also designated SEQ ID:3688.

[36403] Another function of VGAM977 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223). Accordingly, utilities of VGAM977 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2. KIAA0342 (Accession XM_047357) is another VGAM977 host target gene. KIAA0342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0342 BINDING SITE, designated SEQ ID:34960, to the nucleotide sequence of VGAM977 RNA, herein designated VGAM RNA, also designated SEQ ID:3688.

[36404] Another function of VGAM977 is therefore inhibition of KIAA0342 (Accession XM_047357). Accordingly, utilities of VGAM977 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0342. KIAA1948 (Accession XM_091984) is another VGAM977 host target gene. KIAA1948 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1948 BINDING SITE, designated SEQ ID:40083, to the nucleotide sequence of VGAM977 RNA, herein designated VGAM RNA, also designated SEQ ID:3688.

[36405] Another function of VGAM977 is therefore inhibition of KIAA1948 (Accession XM_091984). Accordingly, utilities of VGAM977 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1948. MAC30 (Accession XM_031536) is another VGAM977 host target gene. MAC30 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAC30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAC30 BINDING SITE, designated SEQ ID:31404, to the nucleotide sequence of VGAM977 RNA, herein designated VGAM RNA,

also designated SEQ ID:3688.

[36406] Another function of VGAM977 is therefore inhibition of MAC30 (Accession XM_031536). Accordingly, utilities of VGAM977 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAC30. MY014 (Accession NM_030918) is another VGAM977 host target gene. MY014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MY014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MY014 BINDING SITE, designated SEQ ID:25189, to the nucleotide sequence of VGAM977 RNA, herein designated VGAM RNA, also designated SEQ ID:3688.

[36407] Another function of VGAM977 is therefore inhibition of MY014 (Accession NM_030918). Accordingly, utilities of VGAM977 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MY014. LOC158056 (Accession XM_088463) is another VGAM977 host target gene. LOC158056 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158056, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158056 BINDING SITE, designated SEQ ID:39713, to the nucleotide sequence of VGAM977 RNA, herein designated VGAM RNA, also designated SEQ ID:3688.

[36408] Another function of VGAM977 is therefore inhibition of LOC158056 (Accession XM_088463). Accordingly, utilities of VGAM977 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158056. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 978 (VGAM978) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36409] VGAM978 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM978 was detected is described hereinabove with reference to Figs. 1–8.

[36410] VGAM978 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus.

VGAM978 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36411] VGAM978 gene encodes a VGAM978 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM978 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM978 precursor RNA is designated SEQ ID:964, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:964 is located at position 55420 relative to the genome of Ectromelia Virus.

[36412] VGAM978 precursor RNA folds onto itself, forming VGAM978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36413] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM978 folded precursor RNA into VGAM978 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM978 RNA is designated SEQ ID:3689, and is provided hereinbelow with reference to the sequence listing part.

[36414] VGAM978 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM978 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM978 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36415] VGAM978 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM978 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM978 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM978 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM978 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36416] The complementary binding of VGAM978 RNA, herein designated VGAM RNA, to host target binding sites on VGAM978 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM978 host target RNA into VGAM978 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36417] It is appreciated that VGAM978 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM978 host target genes. The mRNA of each one of this plurality of VGAM978 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM978 RNA, herein designated VGAM RNA, and which when bound by VGAM978 RNA causes inhibition of translation of respective one or more VGAM978 host target proteins.

[36418] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM978 gene, herein designated VGAM GENE, on one or more VGAM978 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36419] It is yet further appreciated that a function of VGAM978 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM978 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM978 correlate with, and may be deduced from, the identity of the host target genes which VGAM978 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36420] Nucleotide sequences of the VGAM978 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM978 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM978 are further described hereinbelow with reference to Table 1.

[36421] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM978 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM978 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36422] As mentioned hereinabove with reference to Fig. 1, a function of VGAM978 gene, herein designated VGAM is inhibition of expression of VGAM978 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM978 correlate with, and may be deduced from, the identity of the target genes which VGAM978 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36423] FLJ12806 (Accession NM_022831) is a VGAM978 host target gene. FLJ12806 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12806 BINDING SITE, designated SEQ ID:23110, to the nucleotide sequence of VGAM978

RNA, herein designated VGAM RNA, also designated SEQ ID:3689.

[36424] A function of VGAM978 is therefore inhibition of FLJ12806 (Accession NM_022831). Accordingly, utilities of VGAM978 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12806. LOC157621 (Accession XM_098800) is another VGAM978 host target gene. LOC157621 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157621 BINDING SITE, designated SEQ ID:41824, to the nucleotide sequence of VGAM978 RNA, herein designated VGAM RNA, also designated SEQ ID:3689.

[36425] Another function of VGAM978 is therefore inhibition of LOC157621 (Accession XM_098800). Accordingly, utilities of VGAM978 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157621. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 979 (VGAM979) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36426] VGAM979 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM979 was detected is described hereinabove with reference to Figs. 1–8.

[36427] VGAM979 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM979 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36428] VGAM979 gene encodes a VGAM979 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM979 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM979 precursor RNA is designated SEQ ID:965, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:965 is located at position 50081 relative to the genome of Camelpox Virus.

[36429] VGAM979 precursor RNA folds onto itself, forming VGAM979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36430] An enzyme complex designated DICER COMPLEX, `dices` the VGAM979 folded precursor RNA into VGAM979 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM979 RNA is designated SEQ ID:3690, and is provided hereinbelow with reference to the sequence listing part.

[36431] VGAM979 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM979 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM979 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36432] VGAM979 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM979 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM979 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM979 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM979 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36433] The complementary binding of VGAM979 RNA, herein designated VGAM RNA, to host target binding sites on VGAM979 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM979 host target RNA into VGAM979 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36434] It is appreciated that VGAM979 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM979 host target genes. The mRNA of each one of this plurality of VGAM979 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM979 RNA, herein designated VGAM RNA, and which when bound by VGAM979 RNA causes inhibition of translation of respective one or more VGAM979 host target proteins.

[36435] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM979 gene, herein designated VGAM GENE, on one or more VGAM979 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36436] It is yet further appreciated that a function of VGAM979 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM979 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM979 correlate with, and may be deduced from, the identity of the host

target genes which VGAM979 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36437] Nucleotide sequences of the VGAM979 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM979 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM979 are further described hereinbelow with reference to Table 1.

[36438] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM979 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM979 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36439] As mentioned hereinabove with reference to Fig. 1, a function of VGAM979 gene, herein designated VGAM is inhibition of expression of VGAM979 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM979 correlate with, and may be deduced from, the identity of the target genes which VGAM979

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36440] ACF (Accession NM_014576) is a VGAM979 host target gene. ACF BINDING SITE1 and ACF BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ACF, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACF BINDING SITE1 and ACF BINDING SITE2, designated SEQ ID:15937 and SEQ ID:29058 respectively, to the nucleotide sequence of VGAM979 RNA, herein designated VGAM RNA, also designated SEQ ID:3690.

[36441] A function of VGAM979 is therefore inhibition of ACF (Accession NM_014576). Accordingly, utilities of VGAM979 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACF. p21(CDKN1A)-activated Kinase 7 (PAK7, Accession XM_045653) is another VGAM979 host target gene. PAK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of PAK7 BINDING SITE, designated SEQ ID:34507, to the nucleotide sequence of VGAM979 RNA, herein designated VGAM RNA, also designated SEQ ID:3690.

[36442] Another function of VGAM979 is therefore inhibition of p21(CDKN1A)–activated Kinase 7 (PAK7, Accession XM_045653). Accordingly, utilities of VGAM979 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK7. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 980 (VGAM980) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36443] VGAM980 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM980 was detected is described hereinabove with reference to Figs. 1–8.

[36444] VGAM980 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM980 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[36445] VGAM980 gene encodes a VGAM980 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM980 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM980 precursor RNA is designated SEQ ID:966, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:966 is located at position 54779 relative to the genome of Ectromelia Virus.

[36446] VGAM980 precursor RNA folds onto itself, forming VGAM980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36447] An enzyme complex designated DICER COMPLEX, `dices` the VGAM980 folded precursor RNA into VGAM980 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM980 RNA is designated SEQ ID:3691, and is provided hereinbelow with reference to the sequence listing part.

[36448] VGAM980 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM980 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM980 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36449] VGAM980 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM980 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM980 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM980 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM980 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36450] The complementary binding of VGAM980 RNA, herein designated VGAM RNA, to host target binding sites on VGAM980 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM980 host target RNA into VGAM980 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36451] It is appreciated that VGAM980 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM980 host target genes. The mRNA of each one of this plurality of VGAM980 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM980 RNA, herein designated VGAM RNA, and which when bound by VGAM980 RNA causes inhibition of translation of respective one or more VGAM980 host target proteins.

[36452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM980 gene, herein designated VGAM GENE, on one or more VGAM980 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36453] It is yet further appreciated that a function of VGAM980 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM980 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM980 correlate with, and may be deduced from, the identity of the host target genes which VGAM980 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36454] Nucleotide sequences of the VGAM980 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM980 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM980 are further described hereinbelow with reference to Table 1.

[36455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM980 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM980 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36456] As mentioned hereinabove with reference to Fig. 1, a function of VGAM980 gene, herein designated VGAM is inhibition of expression of VGAM980 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM980 correlate with, and may be deduced from, the identity of the target genes which VGAM980 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36457] Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is a VGAM980 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14877, to the nucleotide sequence of VGAM980 RNA, herein designated VGAM RNA, also designated SEQ

ID:3691.

[36458] A function of VGAM980 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM980 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.KIAA1468 (Accession XM_166289) is another VGAM980 host target gene. KIAA1468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1468 BINDING SITE, designated SEQ ID:44097, to the nucleotide sequence of VGAM980 RNA, herein designated VGAM RNA, also designated SEQ ID:3691.

[36459] Another function of VGAM980 is therefore inhibition of KIAA1468 (Accession XM_166289). Accordingly, utilities of VGAM980 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1468. KIAA1979 (Accession XM_113984) is another VGAM980 host target gene. KIAA1979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1979 BINDING SITE, designated SEQ ID:42588, to the nucleotide sequence of VGAM980 RNA, herein designated VGAM RNA, also designated SEQ ID:3691.

[36460] Another function of VGAM980 is therefore inhibition of KIAA1979 (Accession XM_113984). Accordingly, utilities of VGAM980 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1979. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 981 (VGAM981) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36461] VGAM981 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM981 was detected is described hereinabove with reference to Figs. 1–8.

[36462] VGAM981 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM981 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36463] VGAM981 gene encodes a VGAM981 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM981 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM981 precursor RNA is designated SEQ ID:967, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:967 is located at position 62393 relative to the genome of Cowpox Virus.

[36464] VGAM981 precursor RNA folds onto itself, forming VGAM981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36465] An enzyme complex designated DICER COMPLEX, `dices` the VGAM981 folded precursor RNA into VGAM981 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM981 RNA is designated SEQ ID:3692, and is provided hereinbelow with reference to the sequence listing part.

[36466] VGAM981 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM981 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM981 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36467] VGAM981 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM981 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM981 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM981 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM981 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36468] The complementary binding of VGAM981 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM981 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM981 host target RNA into VGAM981 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36469] It is appreciated that VGAM981 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM981 host target genes. The mRNA of each one of this plurality of VGAM981 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM981 RNA, herein designated VGAM RNA, and which when bound by VGAM981 RNA causes inhibition of translation of respective one or more VGAM981 host target proteins.

[36470] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM981 gene, herein designated VGAM GENE, on one or more VGAM981 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36471] It is yet further appreciated that a function of VGAM981 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM981 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM981 correlate with, and may be deduced from, the identity of the host target genes which VGAM981 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36472] Nucleotide sequences of the VGAM981 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM981 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM981 are further described hereinbelow with reference to Table 1.

[36473] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM981 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM981 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36474] As mentioned hereinabove with reference to Fig. 1, a function of VGAM981 gene, herein designated VGAM is inhibition of expression of VGAM981 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM981 correlate with, and may be deduced from, the identity of the target genes which VGAM981 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36475] DKFZp761O0113 (Accession NM_018409) is a VGAM981 host target gene. DKFZp761O0113 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by DKFZp761O0113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761O0113 BINDING SITE, designated SEQ ID:20446, to the nucleotide sequence of VGAM981 RNA, herein designated VGAM RNA, also designated SEQ ID:3692.

[36476] A function of VGAM981 is therefore inhibition of DKFZp761O0113 (Accession NM_018409). Accordingly, utilities of VGAM981 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O0113. KIAA1084 (Accession NM_014910) is another VGAM981 host target gene. KIAA1084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1084 BINDING SITE, designated SEQ ID:17136, to the nucleotide sequence of VGAM981 RNA, herein designated VGAM RNA, also designated SEQ ID:3692.

[36477] Another function of VGAM981 is therefore inhibition of KIAA1084 (Accession NM_014910). Accordingly, utilities

of VGAM981 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1084. LOC158629 (Accession XM_098972) is another VGAM981 host target gene. LOC158629 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158629, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158629 BINDING SITE, designated SEQ ID:42021, to the nucleotide sequence of VGAM981 RNA, herein designated VGAM RNA, also designated SEQ ID:3692.

[36478] Another function of VGAM981 is therefore inhibition of LOC158629 (Accession XM_098972). Accordingly, utilities of VGAM981 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158629. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 982 (VGAM982) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36479] VGAM982 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM982 was detected is described hereinabove with reference to Figs. 1–8.

[36480] VGAM982 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus.

VGAM982 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36481] VGAM982 gene encodes a VGAM982 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM982 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM982 precursor RNA is designated SEQ ID:968, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:968 is located at position 54629 relative to the genome of Ectromelia Virus.

[36482] VGAM982 precursor RNA folds onto itself, forming VGAM982 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36483] An enzyme complex designated DICER COMPLEX, `dices` the VGAM982 folded precursor RNA into VGAM982 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM982 RNA is designated SEQ ID:3693, and is provided hereinbelow with reference to the sequence listing part.

[36484] VGAM982 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM982 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM982 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[36485] VGAM982 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM982 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM982 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM982 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM982 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36486] The complementary binding of VGAM982 RNA, herein designated VGAM RNA, to host target binding sites on VGAM982 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM982 host target RNA into VGAM982 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36487] It is appreciated that VGAM982 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM982 host target genes. The mRNA of each one of this plurality of VGAM982 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM982 RNA, herein designated VGAM RNA, and which when bound by VGAM982 RNA causes inhibition of translation of respective one or more VGAM982 host target proteins.

[36488] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM982 gene, herein designated VGAM GENE, on one or more VGAM982 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36489] It is yet further appreciated that a function of VGAM982 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM982 correlate with, and may be deduced from, the identity of the host target genes which VGAM982 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36490] Nucleotide sequences of the VGAM982 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM982 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM982 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM982 are further
described hereinbelow with reference to Table 1.

[36491] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM982 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM982 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[36492] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM982 gene, herein designated VGAM is
inhibition of expression of VGAM982 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM982 correlate with, and may be deduced
from, the identity of the target genes which VGAM982
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[36493] Leucine Zipper-EF-hand Containing Transmembrane Pro-
tein 1 (LETM1, Accession NM_012318) is a VGAM982 host

target gene. LETM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LETM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LETM1 BINDING SITE, designated SEQ ID:14696, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36494] A function of VGAM982 is therefore inhibition of Leucine Zipper-EF-hand Containing Transmembrane Protein 1 (LETM1, Accession NM_012318). Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LETM1. Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_002848) is another VGAM982 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1 through PTPRO BINDING SITE5, designated SEQ

ID:8737, SEQ ID:25002, SEQ ID:25008, SEQ ID:25017 and SEQ ID:25026 respectively, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36495] Another function of VGAM982 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_002848), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM982 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15355, to the nucleotide sequence of VGAM982 RNA,

herein designated VGAM RNA, also designated SEQ ID:3693.

[36496] Another function of VGAM982 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726) is another VGAM982 host target gene. ABCC13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCC13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC13 BINDING SITE, designated SEQ ID:28973, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36497] Another function of VGAM982 is therefore inhibition of

ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726). Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC13. Chromosome 22 Open Reading Frame 20 (C22orf20, Accession NM_025225) is another VGAM982 host target gene. C22orf20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C22orf20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf20 BINDING SITE, designated SEQ ID:24901, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36498] Another function of VGAM982 is therefore inhibition of Chromosome 22 Open Reading Frame 20 (C22orf20, Accession NM_025225). Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf20. FLJ12056 (Accession NM_024933) is another VGAM982 host target gene. FLJ12056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ12056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12056 BINDING SITE, designated SEQ ID:24469, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36499] Another function of VGAM982 is therefore inhibition of FLJ12056 (Accession NM_024933). Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12056. FLJ30681 (Accession XM_166291) is another VGAM982 host target gene. FLJ30681 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30681 BINDING SITE, designated SEQ ID:44105, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36500] Another function of VGAM982 is therefore inhibition of FLJ30681 (Accession XM_166291). Accordingly, utilities of

VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30681. HSA249128 (Accession NM_017583) is another VGAM982 host target gene. HSA249128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA249128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA249128 BINDING SITE, designated SEQ ID:19028, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36501] Another function of VGAM982 is therefore inhibition of HSA249128 (Accession NM_017583). Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA249128. KIAA0774 (Accession XM_166270) is another VGAM982 host target gene. KIAA0774 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0774, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0774 BINDING SITE, designated SEQ ID:44087, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36502] Another function of VGAM982 is therefore inhibition of KIAA0774 (Accession XM_166270). Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0774. KIAA1867 (Accession XM_170675) is another VGAM982 host target gene. KIAA1867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1867 BINDING SITE, designated SEQ ID:45456, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36503] Another function of VGAM982 is therefore inhibition of KIAA1867 (Accession XM_170675). Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1867. LAP1B (Accession XM_035429) is another VGAM982 host target gene. LAP1B BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by LAP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAP1B BINDING SITE, designated SEQ ID:32264, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36504] Another function of VGAM982 is therefore inhibition of LAP1B (Accession XM_035429). Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAP1B. MGC4796 (Accession XM_029031) is another VGAM982 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30827, to the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, also designated SEQ ID:3693.

[36505] Another function of VGAM982 is therefore inhibition of

MGC4796 (Accession XM_029031). Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4796. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 983 (VGAM983) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36506] VGAM983 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM983 was detected is described hereinabove with reference to Figs. 1–8.

[36507] VGAM983 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM983 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36508] VGAM983 gene encodes a VGAM983 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM983 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM983 precursor RNA is designated SEQ ID:969, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:969 is located at position 54050 relative to the genome of Ectromelia Virus.

[36509] VGAM983 precursor RNA folds onto itself, forming VGAM983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36510] An enzyme complex designated DICER COMPLEX, `dices` the VGAM983 folded precursor RNA into VGAM983 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM983 RNA is designated SEQ ID:3694, and is provided hereinbelow with reference to the sequence listing part.

[36511] VGAM983 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM983 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM983 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[36512] VGAM983 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM983 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM983 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM983 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM983 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[36513] The complementary binding of VGAM983 RNA, herein designated VGAM RNA, to host target binding sites on VGAM983 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM983 host target RNA into VGAM983 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36514] It is appreciated that VGAM983 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM983 host target genes. The mRNA of each one of this plurality of VGAM983 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM983 RNA, herein designated VGAM RNA, and which when bound by VGAM983 RNA causes inhibition of translation of respective one or more VGAM983 host target proteins.

[36515] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM983 gene, herein designated VGAM GENE, on one or more VGAM983 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36516] It is yet further appreciated that a function of VGAM983 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM983 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM983 correlate with, and may be deduced from, the identity of the host target genes which VGAM983 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[36517] Nucleotide sequences of the VGAM983 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM983 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM983 are further described hereinbelow with reference to Table 1.

[36518] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM983 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM983 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36519] As mentioned hereinabove with reference to Fig. 1, a function of VGAM983 gene, herein designated VGAM is inhibition of expression of VGAM983 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM983 correlate with, and may be deduced from, the identity of the target genes which VGAM983 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36520] Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM_001056) is a VGAM983 host target gene. SULT1C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SULT1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1C1 BINDING SITE, designated SEQ ID:6718, to the nucleotide sequence of VGAM983 RNA, herein designated VGAM RNA, also designated SEQ ID:3694.

[36521] A function of VGAM983 is therefore inhibition of Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM_001056). Accordingly, utilities of VGAM983 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with SULT1C1. Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709) is another VGAM983 host target gene. CXorf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf1 BINDING SITE, designated SEQ ID:11052, to the nucleotide sequence of VGAM983 RNA, herein designated VGAM RNA, also designated SEQ ID:3694.

[36522] Another function of VGAM983 is therefore inhibition of Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709). Accordingly, utilities of VGAM983 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf1. KIAA1211 (Accession XM_044178) is another VGAM983 host target gene. KIAA1211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of KIAA1211 BINDING SITE, designated SEQ ID:34164, to the nucleotide sequence of VGAM983 RNA, herein designated VGAM RNA, also designated SEQ ID:3694.

[36523] Another function of VGAM983 is therefore inhibition of KIAA1211 (Accession XM_044178). Accordingly, utilities of VGAM983 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM_030373) is another VGAM983 host target gene. SH3BGRL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL BINDING SITE, designated SEQ ID:31022, to the nucleotide sequence of VGAM983 RNA, herein designated VGAM RNA, also designated SEQ ID:3694.

[36524] Another function of VGAM983 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM_030373). Accordingly, utilities of VGAM983 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SH3BGRL. LOC221143 (Accession XM_167986) is another VGAM983 host target gene. LOC221143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221143 BINDING SITE, designated SEQ ID:44940, to the nucleotide sequence of VGAM983 RNA, herein designated VGAM RNA, also designated SEQ ID:3694.

[36525] Another function of VGAM983 is therefore inhibition of LOC221143 (Accession XM_167986). Accordingly, utilities of VGAM983 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221143. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 984 (VGAM984) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36526] VGAM984 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM984 was detected is described hereinabove with reference to Figs. 1–8.

[36527] VGAM984 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM984 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36528] VGAM984 gene encodes a VGAM984 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM984 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM984 precursor RNA is designated SEQ ID:970, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:970 is located at position 64055 relative to the genome of Cowpox Virus.

[36529] VGAM984 precursor RNA folds onto itself, forming VGAM984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36530] An enzyme complex designated DICER COMPLEX, `dices` the VGAM984 folded precursor RNA into VGAM984 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM984 RNA is designated SEQ ID:3695, and is provided hereinbelow with reference to the sequence listing part.

[36531] VGAM984 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM984 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM984 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36532] VGAM984 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM984 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM984 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM984 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM984 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36533] The complementary binding of VGAM984 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM984 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM984 host target RNA into VGAM984 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36534] It is appreciated that VGAM984 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM984 host target genes. The mRNA of each one of this plurality of VGAM984 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM984 RNA, herein designated VGAM RNA, and which when bound by VGAM984 RNA causes inhibition of translation of respective one or more VGAM984 host target proteins.

[36535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM984 gene, herein designated VGAM GENE, on one or more VGAM984 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36536] It is yet further appreciated that a function of VGAM984 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM984 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM984 correlate with, and may be deduced from, the identity of the host target genes which VGAM984 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36537] Nucleotide sequences of the VGAM984 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM984 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM984 are further described hereinbelow with reference to Table 1.

[36538] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM984 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM984 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36539] As mentioned hereinabove with reference to Fig. 1, a function of VGAM984 gene, herein designated VGAM is inhibition of expression of VGAM984 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM984 correlate with, and may be deduced from, the identity of the target genes which VGAM984 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36540] KIAA0442 (Accession NM_015570) is a VGAM984 host target gene. KIAA0442 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by KIAA0442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0442 BINDING SITE, designated SEQ ID:17842, to the nucleotide sequence of VGAM984 RNA, herein designated VGAM RNA, also designated SEQ ID:3695.

[36541] A function of VGAM984 is therefore inhibition of KIAA0442 (Accession NM_015570). Accordingly, utilities of VGAM984 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0442. KIAA0711 (Accession NM_014867) is another VGAM984 host target gene. KIAA0711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0711 BINDING SITE, designated SEQ ID:16953, to the nucleotide sequence of VGAM984 RNA, herein designated VGAM RNA, also designated SEQ ID:3695.

[36542] Another function of VGAM984 is therefore inhibition of KIAA0711 (Accession NM_014867). Accordingly, utilities

of VGAM984 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0711. KIAA1240 (Accession XM_039676) is another VGAM984 host target gene. KIAA1240 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1240 BINDING SITE, designated SEQ ID:33143, to the nucleotide sequence of VGAM984 RNA, herein designated VGAM RNA, also designated SEQ ID:3695.

[36543] Another function of VGAM984 is therefore inhibition of KIAA1240 (Accession XM_039676). Accordingly, utilities of VGAM984 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1240. PRO0245 (Accession NM_014122) is another VGAM984 host target gene. PRO0245 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0245

BINDING SITE, designated SEQ ID:15376, to the nucleotide sequence of VGAM984 RNA, herein designated VGAM RNA, also designated SEQ ID:3695.

[36544] Another function of VGAM984 is therefore inhibition of PRO0245 (Accession NM_014122). Accordingly, utilities of VGAM984 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0245. ZFD25 (Accession NM_016220) is another VGAM984 host target gene. ZFD25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFD25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFD25 BINDING SITE, designated SEQ ID:18319, to the nucleotide sequence of VGAM984 RNA, herein designated VGAM RNA, also designated SEQ ID:3695.

[36545] Another function of VGAM984 is therefore inhibition of ZFD25 (Accession NM_016220). Accordingly, utilities of VGAM984 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFD25. LOC157381 (Accession XM_098754) is another VGAM984 host target gene. LOC157381 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by LOC157381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157381 BINDING SITE, designated SEQ ID:41792, to the nucleotide sequence of VGAM984 RNA, herein designated VGAM RNA, also designated SEQ ID:3695.

[36546] Another function of VGAM984 is therefore inhibition of LOC157381 (Accession XM_098754). Accordingly, utilities of VGAM984 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157381. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 985 (VGAM985) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36547] VGAM985 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM985 was detected is described hereinabove with reference to Figs. 1-8.

[36548] VGAM985 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM985 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36549] VGAM985 gene encodes a VGAM985 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM985 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM985 precursor RNA is designated SEQ ID:971, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:971 is located at position 26086 relative to the genome of Human Herpesvirus 3.

[36550] VGAM985 precursor RNA folds onto itself, forming VGAM985 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[36551] An enzyme complex designated DICER COMPLEX, `dices` the VGAM985 folded precursor RNA into VGAM985 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM985 RNA is designated SEQ ID:3696, and is provided hereinbelow with reference to the sequence listing part.

[36552] VGAM985 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM985 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM985 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36553] VGAM985 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM985 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM985 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM985 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM985 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[36554] The complementary binding of VGAM985 RNA, herein designated VGAM RNA, to host target binding sites on VGAM985 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM985 host target RNA into VGAM985 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36555] It is appreciated that VGAM985 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM985 host target genes. The mRNA of each one of this plurality of VGAM985 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM985 RNA, herein designated VGAM RNA, and which when bound by VGAM985 RNA causes inhibition of translation of respective one or more VGAM985 host target proteins.

[36556] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM985 gene, herein designated VGAM GENE, on one or more VGAM985 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36557] It is yet further appreciated that a function of VGAM985 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM985 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM985 correlate with, and may be deduced from, the identity of the host target genes which VGAM985 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36558] Nucleotide sequences of the VGAM985 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM985 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM985 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM985 are further described hereinbelow with reference to Table 1.

[36559] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM985 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM985 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36560] As mentioned hereinabove with reference to Fig. 1, a function of VGAM985 gene, herein designated VGAM is inhibition of expression of VGAM985 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM985 correlate with, and may be deduced from, the identity of the target genes which VGAM985 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36561] Myosin XVA (MYO15A, Accession NM_016239) is a VGAM985 host target gene. MYO15A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYO15A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MYO15A BINDING SITE, designated SEQ ID:18353, to the nucleotide sequence of VGAM985 RNA, herein designated VGAM RNA, also designated SEQ ID:3696.

[36562] A function of VGAM985 is therefore inhibition of Myosin XVA (MYO15A, Accession NM_016239), a gene which acts as actin-based motors. Accordingly, utilities of VGAM985 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO15A. The function of MYO15A has been established by previous studies. Shaker-2 (sh2) is a recessive mouse mutation on chromosome 11 that arose in the progeny of an x-ray irradiated mouse and has been proposed as the mouse model of DFNB3 (OMIM Ref. No. 600316), an autosomal recessive form of human deafness that maps to 17p11.2. Affected mice lack normal startle response to sound and show no auditory brain stem responses to sound pressure levels up to high levels, indicating profound deafness. Associated vestibular defects cause head-tossing and circling behavior. Fine genetic mapping of the sh2 gene identified 4 genes in a region of chromosome 11 that have homologs mapping to 17p11.2 in the human. Complete 1-Mb yeast artificial chromosome (YAC) and bacte-

rial artificial chromosome (BAC) contigs that spanned the shaker-2 critical region were generated. Because there were no compelling candidate genes in the nonrecombinant region, Probst et al. (1998) adopted an in vivo complementation approach to narrow the sh2 critical region. A BAC transgene from the shaker-2 critical region corrected the vestibular defects, deafness, and inner ear morphology of shaker-2 mice. An unconventional myosin gene, Myo15, was discovered by DNA sequencing of this BAC. Shaker-2 mice were found to have an amino acid substitution at a highly conserved position within the motor domain of this myosin. Auditory hair cells of shaker-2 mice have very short stereocilia and a long actin-containing protrusion extending from the basal end. This histopathology suggests that Myo15 is necessary for actin organization in the hair cells of the cochlea. In 3 consanguineous families from Pakistan and India, Liburd et al. (2001) found novel homozygous mutations in the MYO15A gene associated with profound congenital hearing loss, including Q1229X (602666.0004), IVS4+1G-T (602666.0005), and Q2716H (602666.0006). In addition, a hemizygous missense mutation, T2205I (602666.0007), was found in a patient with Smith-Magenis syndrome

(OMIM Ref. No. 182290) due to a deletion in 17p11.2. The patient had moderately severe hearing loss. The mother was heterozygous for the T2205I mutation.

[36563] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[36564] Liburd, N.; Ghosh, M.; Riazuddin, S.; Naz, S.; Khan, S.; Ahmed, Z.; Riazuddin, S.; Liang, Y.; Menon, P. S. N.; Smith, T.; Smith, A. C. M.; Chen, K.-S.; Lupski, J. R.; Wilcox, E. R.; Potocki, L.; Friedman, T. B. : Novel mutations of MYO15A associated with profound deafness in consanguineous families and moderately severe hearing loss in a patient with Smith–Magenis syndrome. Hum. Genet. 109: 535–541, 2001. ; and

[36566] Further studies establishing the function and utilities of MYO15A are found in John Hopkins OMIM database record ID 602666, and in cited publications numbered 722 and 7223–7224 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer–

ence.KIAA0514 (Accession NM_014696) is another VGAM985 host target gene. KIAA0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16202, to the nucleotide sequence of VGAM985 RNA, herein designated VGAM RNA, also designated SEQ ID:3696.

[36567] Another function of VGAM985 is therefore inhibition of KIAA0514 (Accession NM_014696). Accordingly, utilities of VGAM985 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. Mitogen-activated Protein Kinase Kinase 3 (MAP2K3, Accession NM_145109) is another VGAM985 host target gene. MAP2K3 BINDING SITE1 and MAP2K3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAP2K3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K3 BINDING SITE1 and MAP2K3 BINDING SITE2,

designated SEQ ID:29713 and SEQ ID:8636 respectively, to the nucleotide sequence of VGAM985 RNA, herein designated VGAM RNA, also designated SEQ ID:3696.

[36568] Another function of VGAM985 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 3 (MAP2K3, Accession NM_145109). Accordingly, utilities of VGAM985 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K3.

LOC148824 (Accession XM_097527) is another VGAM985 host target gene. LOC148824 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148824 BINDING SITE, designated SEQ ID:40906, to the nucleotide sequence of VGAM985 RNA, herein designated VGAM RNA, also designated SEQ ID:3696.

[36569] Another function of VGAM985 is therefore inhibition of LOC148824 (Accession XM_097527). Accordingly, utilities of VGAM985 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148824. LOC219690 (Accession XM_167572) is an-

other VGAM985 host target gene. LOC219690 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219690 BINDING SITE, designated SEQ ID:44705, to the nucleotide sequence of VGAM985 RNA, herein designated VGAM RNA, also designated SEQ ID:3696.

[36570] Another function of VGAM985 is therefore inhibition of LOC219690 (Accession XM_167572). Accordingly, utilities of VGAM985 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219690. LOC221431 (Accession XM_166380) is another VGAM985 host target gene. LOC221431 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221431 BINDING SITE, designated SEQ ID:44221, to the nucleotide sequence of VGAM985 RNA, herein designated VGAM RNA, also designated SEQ ID:3696.

[36571] Another function of VGAM985 is therefore inhibition of LOC221431 (Accession XM_166380). Accordingly, utilities of VGAM985 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221431. LOC255533 (Accession XM_173073) is another VGAM985 host target gene. LOC255533 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255533 BINDING SITE, designated SEQ ID:46329, to the nucleotide sequence of VGAM985 RNA, herein designated VGAM RNA, also designated SEQ ID:3696.

[36572] Another function of VGAM985 is therefore inhibition of LOC255533 (Accession XM_173073). Accordingly, utilities of VGAM985 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255533. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 986 (VGAM986) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[36573] VGAM986 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM986 was detected is described hereinabove with reference to Figs. 1–8.

[36574] VGAM986 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–4. VGAM986 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36575] VGAM986 gene encodes a VGAM986 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM986 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM986 precursor RNA is designated SEQ ID:972, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:972 is located at position 377 relative to the genome of Leishmania RNA Virus 1–4.

[36576] VGAM986 precursor RNA folds onto itself, forming VGAM986 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[36577] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM986 folded precursor RNA into VGAM986 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 43%) nucleotide se-
quence of VGAM986 RNA is designated SEQ ID:3697, and
is provided hereinbelow with reference to the sequence
listing part.

[36578] VGAM986 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM986 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM986 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36579] VGAM986 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM986 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM986 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM986 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM986 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36580] The complementary binding of VGAM986 RNA, herein designated VGAM RNA, to host target binding sites on VGAM986 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM986 host target RNA into VGAM986 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36581] It is appreciated that VGAM986 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM986 host target genes. The mRNA of each one of this plurality of VGAM986 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM986 RNA, herein designated VGAM RNA, and which when bound by VGAM986 RNA causes inhibition of translation of respective one or more VGAM986 host target proteins.

[36582] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM986 gene, herein designated VGAM GENE, on one or more VGAM986 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36583] It is yet further appreciated that a function of VGAM986 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM986 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1-4. Specific functions, and accordingly utilities, of VGAM986 correlate with, and may be deduced from, the identity of the host target genes which VGAM986 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [36584] Nucleotide sequences of the VGAM986 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM986 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM986 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM986 are further described hereinbelow with reference to Table 1.
- [36585] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM986 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM986 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [36586] As mentioned hereinabove with reference to Fig. 1, a function of VGAM986 gene, herein designated VGAM is inhibition of expression of VGAM986 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM986 correlate with, and may be deduced from, the identity of the target genes which VGAM986 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36587] SudD Suppressor of BimD6 Homolog (*A. nidulans*) (SUDD, Accession NM_003831) is a VGAM986 host target gene. SUDD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUDD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUDD BINDING SITE, designated SEQ ID:9922, to the nucleotide sequence of VGAM986 RNA, herein designated VGAM RNA, also designated SEQ ID:3697.

[36588] A function of VGAM986 is therefore inhibition of SudD Suppressor of BimD6 Homolog (*A. nidulans*) (SUDD, Accession NM_003831). Accordingly, utilities of VGAM986 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUDD. Von Hippel-Lindau Binding Protein 1 (VBP1, Accession NM_003372) is another VGAM986 host target gene. VBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VBP1 BINDING SITE, designated SEQ ID:9399, to the nucleotide sequence

of VGAM986 RNA, herein designated VGAM RNA, also designated SEQ ID:3697.

[36589] Another function of VGAM986 is therefore inhibition of Von Hippel–Lindau Binding Protein 1 (VBP1, Accession NM_003372), a gene which binds specifically to cytosolic chaperonin (c-cpn) and transfers target proteins to it. Accordingly, utilities of VGAM986 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VBP1. The function of VBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM945. Vasoactive Intestinal Peptide (VIP, Accession NM_003381) is another VGAM986 host target gene. VIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIP BINDING SITE, designated SEQ ID:9411, to the nucleotide sequence of VGAM986 RNA, herein designated VGAM RNA, also designated SEQ ID:3697.

[36590] Another function of VGAM986 is therefore inhibition of

Vasoactive Intestinal Peptide (VIP, Accession NM_003381), a gene which causes vasodilation, lowers arterial blood pressure, stimulates myocardial contractility, increases glycogenolysis and relaxes the smooth muscle . Accordingly, utilities of VGAM986 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIP. The function of VIP has been established by previous studies. Vasoactive intestinal peptide is a neuropeptide present in the lymphoid microenvironment that elicits a broad spectrum of biologic functions, including the modulation of innate and adaptive immunity, and shows a predominant antiinflammatory action. VIP promotes TH2 differentiation and inhibits TH1 responses by regulating macrophage costimulatory signals and probably IL12/IFN-gamma production. In collagen-induced arthritis, a murine model for rheumatoid arthritis, Delgado et al. (2001) administered VIP daily or on alternate days for 2 weeks. Treatment with VIP significantly reduced incidence and severity of arthritis in this model, completely abrogating joint swelling and destruction of cartilage and bone. The therapeutic effect of VIP was associated with downregulation of both inflammatory and autoimmune components of the disease. Delgado et al. (2001) con-

cluded that VIP is a viable candidate for the development of treatments for rheumatoid arthritis. Vasoactive intestinal peptide is a neuropeptide present in the lymphoid microenvironment that elicits a broad spectrum of biologic functions, including the modulation of innate and adaptive immunity, and shows a predominant antiinflammatory action. VIP promotes TH2 differentiation and inhibits TH1 responses by regulating macrophage costimulatory signals and probably IL12/IFN-gamma production. In collagen-induced arthritis, a murine model for rheumatoid arthritis, Delgado et al. (2001) administered VIP daily or on alternate days for 2 weeks. Treatment with VIP significantly reduced incidence and severity of arthritis in this model, completely abrogating joint swelling and destruction of cartilage and bone. The therapeutic effect of VIP was associated with downregulation of both inflammatory and autoimmune components of the disease. Delgado et al. (2001) concluded that VIP is a viable candidate for the development of treatments for rheumatoid arthritis.

[36591] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[36592] Linder, S.; Barkhem, T.; Norberg, A.; Persson, H.;

Schalling, M.; Hokfelt, T.; Magnusson, G. : Structure and expression of the gene encoding the vasoactive intestinal peptide precursor. Proc. Nat. Acad. Sci. 84: 605–609, 1987. ; and

[36593] Delgado, M.; Abad, C.; Martinez, C.; Leceta, J.; Gomariz, R. P. : Vasoactive intestinal peptide prevents experimental arthritis by downregulating both autoimmune and inflammatory component.

[36594] Further studies establishing the function and utilities of VIP are found in John Hopkins OMIM database record ID 192320, and in cited publications numbered 9663–967 and 11146 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC144467 (Accession NM_138473) is another VGAM986 host target gene. LOC144467 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144467, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144467 BINDING SITE, designated SEQ ID:28820, to the nucleotide sequence of VGAM986 RNA, herein designated VGAM RNA, also designated SEQ ID:3697.

[36595] Another function of VGAM986 is therefore inhibition of LOC144467 (Accession NM_138473). Accordingly, utilities of VGAM986 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144467. LOC50999 (Accession NM_016040) is another VGAM986 host target gene. LOC50999 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC50999, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC50999 BINDING SITE, designated SEQ ID:18115, to the nucleotide sequence of VGAM986 RNA, herein designated VGAM RNA, also designated SEQ ID:3697.

[36596] Another function of VGAM986 is therefore inhibition of LOC50999 (Accession NM_016040). Accordingly, utilities of VGAM986 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC50999. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 987 (VGAM987) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[36597] VGAM987 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM987 was detected is described hereinabove with reference to Figs. 1–8.

[36598] VGAM987 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–4. VGAM987 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36599] VGAM987 gene encodes a VGAM987 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM987 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM987 precursor RNA is designated SEQ ID:973, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:973 is located at position 1955 relative to the genome of Leishmania RNA Virus 1–4.

[36600] VGAM987 precursor RNA folds onto itself, forming VGAM987 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[36601] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM987 folded precursor RNA into VGAM987 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 52%) nucleotide se-
quence of VGAM987 RNA is designated SEQ ID:3698, and
is provided hereinbelow with reference to the sequence
listing part.

[36602] VGAM987 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM987 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM987 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36603] VGAM987 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM987 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM987 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM987 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM987 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36604] The complementary binding of VGAM987 RNA, herein designated VGAM RNA, to host target binding sites on VGAM987 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM987 host target RNA into VGAM987 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36605] It is appreciated that VGAM987 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM987 host target genes. The mRNA of each one of this plurality of VGAM987 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM987 RNA, herein designated VGAM RNA, and which when bound by VGAM987 RNA causes inhibition of translation of respective one or more VGAM987 host target proteins.

[36606] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM987 gene, herein designated VGAM GENE, on one or more VGAM987 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36607] It is yet further appreciated that a function of VGAM987 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM987 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1-4. Specific functions, and accordingly utilities, of VGAM987 correlate with, and may be deduced from, the identity of the host target genes which VGAM987 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[36608] Nucleotide sequences of the VGAM987 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM987 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM987 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM987 are further described hereinbelow with reference to Table 1.

[36609] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM987 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM987 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36610] As mentioned hereinabove with reference to Fig. 1, a function of VGAM987 gene, herein designated VGAM is inhibition of expression of VGAM987 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM987 correlate with, and may be deduced from, the identity of the target genes which VGAM987 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36611] MGC2835 (Accession NM_024072) is a VGAM987 host target gene. MGC2835 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2835 BINDING SITE, designated SEQ ID:23503, to the nucleotide sequence of VGAM987 RNA, herein designated VGAM RNA, also designated SEQ ID:3698.

[36612] A function of VGAM987 is therefore inhibition of MGC2835 (Accession NM_024072). Accordingly, utilities of VGAM987 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2835. LOC143888 (Accession XM_084669) is another VGAM987 host target gene. LOC143888 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143888 BINDING SITE, designated SEQ ID:37667, to the nucleotide sequence of VGAM987 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3698.

[36613] Another function of VGAM987 is therefore inhibition of LOC143888 (Accession XM_084669). Accordingly, utilities of VGAM987 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143888. LOC148709 (Accession XM_086281) is another VGAM987 host target gene. LOC148709 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148709 BINDING SITE, designated SEQ ID:38582, to the nucleotide sequence of VGAM987 RNA, herein designated VGAM RNA, also designated SEQ ID:3698.

[36614] Another function of VGAM987 is therefore inhibition of LOC148709 (Accession XM_086281). Accordingly, utilities of VGAM987 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148709. LOC257017 (Accession XM_173227) is another VGAM987 host target gene. LOC257017 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257017, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257017 BINDING SITE, designated SEQ ID:46492, to the nucleotide sequence of VGAM987 RNA, herein designated VGAM RNA, also designated SEQ ID:3698.

[36615] Another function of VGAM987 is therefore inhibition of LOC257017 (Accession XM_173227). Accordingly, utilities of VGAM987 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257017. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 988 (VGAM988) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36616] VGAM988 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM988 was detected is described hereinabove with reference to Figs. 1–8.

[36617] VGAM988 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus

1-4. VGAM988 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36618] VGAM988 gene encodes a VGAM988 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM988 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM988 precursor RNA is designated SEQ ID:974, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:974 is located at position 2513 relative to the genome of Leishmania RNA Virus 1-4.

[36619] VGAM988 precursor RNA folds onto itself, forming VGAM988 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36620] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM988 folded precursor RNA into VGAM988 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM988 RNA is designated SEQ ID:3699, and is provided hereinbelow with reference to the sequence listing part.

[36621] VGAM988 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM988 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM988 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36622] VGAM988 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM988 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM988 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM988 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM988 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36623] The complementary binding of VGAM988 RNA, herein designated VGAM RNA, to host target binding sites on VGAM988 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM988 host target RNA into VGAM988 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36624] It is appreciated that VGAM988 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM988 host target genes. The mRNA of each one of this plurality of VGAM988 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM988 RNA, herein designated VGAM RNA, and which when bound by VGAM988 RNA causes inhibition of translation of respective one or more VGAM988 host target proteins.

[36625] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM988 gene, herein designated VGAM GENE, on one or more VGAM988 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36626] It is yet further appreciated that a function of VGAM988 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1-4. Specific functions, and accordingly utilities, of VGAM988 correlate with, and may be deduced from, the identity of the host target genes which VGAM988 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36627] Nucleotide sequences of the VGAM988 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM988 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM988 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM988 are further described hereinbelow with reference to Table 1.

[36628] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM988 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM988 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36629] As mentioned hereinabove with reference to Fig. 1, a function of VGAM988 gene, herein designated VGAM is inhibition of expression of VGAM988 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM988 correlate with, and may be deduced from, the identity of the target genes which VGAM988 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36630] BRF1 Homolog, Subunit of RNA Polymerase III Transcription Initiation Factor IIIB (*S. cerevisiae*) (BRF1, Accession NM_001519) is a VGAM988 host target gene. BRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRF1

BINDING SITE, designated SEQ ID:7259, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36631] A function of VGAM988 is therefore inhibition of BRF1 Homolog, Subunit of RNA Polymerase III Transcription Initiation Factor IIIB (*S. cerevisiae*) (BRF1, Accession NM_001519), a gene which is a general activator of RNA polymerase III. Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRF1. The function of BRF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. Ladinin 1 (LAD1, Accession NM_005558) is another VGAM988 host target gene. LAD1 BINDING SITE1 and LAD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LAD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAD1 BINDING SITE1 and LAD1 BINDING SITE2, designated SEQ ID:12088 and SEQ ID:12087 respectively, to the nucleotide sequence of VGAM988 RNA, herein designated

VGAM RNA, also designated SEQ ID:3699.

[36632] Another function of VGAM988 is therefore inhibition of Ladinin 1 (LAD1, Accession NM_005558). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAD1. RAB7, Member RAS Oncogene Family (RAB7, Accession NM_004637) is another VGAM988 host target gene. RAB7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB7 BINDING SITE, designated SEQ ID:11012, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36633] Another function of VGAM988 is therefore inhibition of RAB7, Member RAS Oncogene Family (RAB7, Accession NM_004637), a gene which is an important regulator of vesicular transport in the late endocytic pathway. Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB7. The function of RAB7 and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM35. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 2 (RPS6KA2, Accession NM_021135) is another VGAM988 host target gene. RPS6KA2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RPS6KA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA2 BINDING SITE, designated SEQ ID:22107, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36634] Another function of VGAM988 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 2 (RPS6KA2, Accession NM_021135), a gene which phosphorylates a wide range of substrates including ribosomal protein s6. Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA2. The function of RPS6KA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216. Secreted Frizzled-related Protein 1 (SFRP1, Ac-

cession NM_003012) is another VGAM988 host target gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:8930, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36635] Another function of VGAM988 is therefore inhibition of Secreted Frizzled-related Protein 1 (SFRP1, Accession NM_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250. VENT-like Homeobox 2 (VENTX2, Accession NM_014468) is another VGAM988 host target gene. VENTX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

VENTX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VENTX2 BINDING SITE, designated SEQ ID:15818, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36636] Another function of VGAM988 is therefore inhibition of VENT-like Homeobox 2 (VENTX2, Accession NM_014468). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VENTX2. DKFZP564O0423 (Accession XM_166254) is another VGAM988 host target gene. DKFZP564O0423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:44072, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36637] Another function of VGAM988 is therefore inhibition of

DKFZP564O0423 (Accession XM_166254). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423. FK506 Binding Protein 4, 59kDa (FKBP4, Accession NM_002014) is another VGAM988 host target gene. FKBP4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP4 BINDING SITE, designated SEQ ID:7755, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36638] Another function of VGAM988 is therefore inhibition of FK506 Binding Protein 4, 59kDa (FKBP4, Accession NM_002014). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP4. FLJ10932 (Accession NM_018277) is another VGAM988 host target gene. FLJ10932 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10932, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10932 BINDING SITE, designated SEQ ID:20266, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36639] Another function of VGAM988 is therefore inhibition of FLJ10932 (Accession NM_018277). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10932. FLJ13397 (Accession NM_024948) is another VGAM988 host target gene. FLJ13397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13397 BINDING SITE, designated SEQ ID:24501, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36640] Another function of VGAM988 is therefore inhibition of FLJ13397 (Accession NM_024948). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ13397. FLJ22393 (Accession NM_025106) is another VGAM988 host target gene. FLJ22393 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22393 BINDING SITE, designated SEQ ID:24757, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36641] Another function of VGAM988 is therefore inhibition of FLJ22393 (Accession NM_025106). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22393. Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130) is another VGAM988 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GOLPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH3 BINDING SITE, designated SEQ

ID:22687, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36642] Another function of VGAM988 is therefore inhibition of Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH3. MGC15482 (Accession NM_032875) is another VGAM988 host target gene. MGC15482 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15482 BINDING SITE, designated SEQ ID:26697, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36643] Another function of VGAM988 is therefore inhibition of MGC15482 (Accession NM_032875). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15482. Ornithine Decarboxylase Antizyme Inhibitor

(OAZIN, Accession NM_015878) is another VGAM988 host target gene. OAZIN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OAZIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAZIN BINDING SITE, designated SEQ ID:18021, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36644] Another function of VGAM988 is therefore inhibition of Ornithine Decarboxylase Antizyme Inhibitor (OAZIN, Accession NM_015878). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAZIN. Protein Phosphatase 1A (formerly 2C), Magnesium-dependent, Alpha Isoform (PPM1A, Accession NM_021003) is another VGAM988 host target gene. PPM1A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PPM1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPM1A BINDING SITE,

designated SEQ ID:21999, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36645] Another function of VGAM988 is therefore inhibition of Protein Phosphatase 1A (formerly 2C), Magnesium-dependent, Alpha Isoform (PPM1A, Accession NM_021003). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPM1A. Rab11-FIP2 (Accession NM_014904) is another VGAM988 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:17099, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36646] Another function of VGAM988 is therefore inhibition of Rab11-FIP2 (Accession NM_014904). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2. RCD-8 (Accession NM_014329) is another

VGAM988 host target gene. RCD-8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RCD-8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RCD-8 BINDING SITE, designated SEQ ID:15643, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36647] Another function of VGAM988 is therefore inhibition of RCD-8 (Accession NM_014329). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RCD-8. REC8 (Accession NM_005132) is another VGAM988 host target gene. REC8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by REC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REC8 BINDING SITE, designated SEQ ID:11609, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36648] Another function of VGAM988 is therefore inhibition of REC8 (Accession NM_005132). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REC8. TGFB-induced Factor 2 (TALE family homeobox) (TGIF2, Accession NM_021809) is another VGAM988 host target gene. TGIF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGIF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGIF2 BINDING SITE, designated SEQ ID:22367, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36649] Another function of VGAM988 is therefore inhibition of TGFB-induced Factor 2 (TALE family homeobox) (TGIF2, Accession NM_021809). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF2. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285) is another VGAM988 host target gene. TP53INP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

TP53INP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE, designated SEQ ID:27108, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36650] Another function of VGAM988 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1.

LOC139411 (Accession XM_066680) is another VGAM988 host target gene. LOC139411 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139411 BINDING SITE, designated SEQ ID:37342, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36651] Another function of VGAM988 is therefore inhibition of

LOC139411 (Accession XM_066680). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139411. LOC146433 (Accession XM_085458) is another VGAM988 host target gene. LOC146433 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146433, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146433 BINDING SITE, designated SEQ ID:38147, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36652] Another function of VGAM988 is therefore inhibition of LOC146433 (Accession XM_085458). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146433. LOC51104 (Accession NM_016014) is another VGAM988 host target gene. LOC51104 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC51104 BINDING SITE, designated SEQ ID:18091, to the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, also designated SEQ ID:3699.

[36653] Another function of VGAM988 is therefore inhibition of LOC51104 (Accession NM_016014). Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51104. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 989 (VGAM989) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36654] VGAM989 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM989 was detected is described hereinabove with reference to Figs. 1–8.

[36655] VGAM989 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–4. VGAM989 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[36656] VGAM989 gene encodes a VGAM989 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM989 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM989 precursor RNA is designated SEQ ID:975, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:975 is located at position 1535 relative to the genome of Leishmania RNA Virus 1-4.

[36657] VGAM989 precursor RNA folds onto itself, forming VGAM989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36658] An enzyme complex designated DICER COMPLEX, `dices` the VGAM989 folded precursor RNA into VGAM989 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM989 RNA is designated SEQ ID:3700, and is provided hereinbelow with reference to the sequence listing part.

[36659] VGAM989 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM989 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM989 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36660] VGAM989 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM989 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM989 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM989 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM989 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36661] The complementary binding of VGAM989 RNA, herein designated VGAM RNA, to host target binding sites on VGAM989 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM989 host target RNA into VGAM989 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36662] It is appreciated that VGAM989 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM989 host target genes. The mRNA of each one of this plurality of VGAM989 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM989 RNA, herein designated VGAM RNA, and which when bound by VGAM989 RNA causes inhibition of translation of respective one or more VGAM989 host target proteins.

[36663] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM989 gene, herein designated VGAM GENE, on one or more VGAM989 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36664] It is yet further appreciated that a function of VGAM989 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM989 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1-4. Specific functions, and accordingly utilities, of VGAM989 correlate with, and may be deduced from, the identity of the host target genes which VGAM989 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36665] Nucleotide sequences of the VGAM989 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM989 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM989 are further described hereinbelow with reference to Table 1.

[36666] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM989 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM989 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36667] As mentioned hereinabove with reference to Fig. 1, a function of VGAM989 gene, herein designated VGAM is inhibition of expression of VGAM989 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM989 correlate with, and may be deduced from, the identity of the target genes which VGAM989 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36668] Chromosome 7 Open Reading Frame 2 (C7orf2, Accession NM_022458) is a VGAM989 host target gene. C7orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C7orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7orf2 BINDING SITE, designated SEQ ID:22795, to the nucleotide sequence of VGAM989 RNA, herein designated VGAM RNA, also designated SEQ ID:3700.

[36669] A function of VGAM989 is therefore inhibition of Chromosome 7 Open Reading Frame 2 (C7orf2, Accession NM_022458). Accordingly, utilities of VGAM989 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7orf2. FLJ14054 (Accession NM_024563) is another VGAM989 host target gene. FLJ14054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14054 BINDING SITE, designated SEQ ID:23783, to the nucleotide sequence of VGAM989 RNA, herein designated VGAM RNA, also designated SEQ ID:3700.

[36670] Another function of VGAM989 is therefore inhibition of FLJ14054 (Accession NM_024563). Accordingly, utilities of VGAM989 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14054. FLJ20297 (Accession NM_017751) is another VGAM989 host target gene. FLJ20297 BINDING SITE1 and FLJ20297 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20297, cor-

responding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20297 BINDING SITE1 and FLJ20297 BINDING SITE2, designated SEQ ID:19358 and SEQ ID:19648 respectively, to the nucleotide sequence of VGAM989 RNA, herein designated VGAM RNA, also designated SEQ ID:3700.

[36671] Another function of VGAM989 is therefore inhibition of FLJ20297 (Accession NM_017751). Accordingly, utilities of VGAM989 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20297. LOC150776 (Accession XM_032542) is another VGAM989 host target gene. LOC150776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150776 BINDING SITE, designated SEQ ID:31675, to the nucleotide sequence of VGAM989 RNA, herein designated VGAM RNA, also designated SEQ ID:3700.

[36672] Another function of VGAM989 is therefore inhibition of LOC150776 (Accession XM_032542). Accordingly, utilities

of VGAM989 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150776. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 990 (VGAM990) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36673] VGAM990 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM990 was detected is described hereinabove with reference to Figs. 1–8.

[36674] VGAM990 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–4. VGAM990 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36675] VGAM990 gene encodes a VGAM990 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM990 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM990 precursor RNA is designated SEQ ID:976, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:976 is located at position 5193 relative to the genome of Leishmania RNA Virus 1-4.

[36676] VGAM990 precursor RNA folds onto itself, forming VGAM990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36677] An enzyme complex designated DICER COMPLEX, `dices` the VGAM990 folded precursor RNA into VGAM990 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM990 RNA is designated SEQ ID:3701, and

is provided hereinbelow with reference to the sequence listing part.

[36678] VGAM990 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM990 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM990 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36679] VGAM990 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM990 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM990 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM990 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM990 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36680] The complementary binding of VGAM990 RNA, herein designated VGAM RNA, to host target binding sites on VGAM990 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM990 host target RNA into VGAM990 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36681] It is appreciated that VGAM990 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM990 host target genes. The mRNA of each one of this plurality of VGAM990 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM990 RNA, herein designated VGAM RNA, and which when bound by VGAM990 RNA causes inhibition of translation of respective one or more VGAM990 host target proteins.

[36682] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM990 gene, herein designated VGAM GENE, on one or more VGAM990 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36683] It is yet further appreciated that a function of VGAM990 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1–4. Specific functions, and accordingly utilities, of VGAM990 correlate with, and may be deduced from, the identity of the host target genes which VGAM990 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36684] Nucleotide sequences of the VGAM990 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM990 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM990 are further described hereinbelow with reference to Table 1.

[36685] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM990 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM990 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36686] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM990 gene, herein designated VGAM is inhibition of expression of VGAM990 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM990 correlate with, and may be deduced from, the identity of the target genes which VGAM990 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36687] Down Syndrome Critical Region Gene 1 (DSCR1, Accession NM_004414) is a VGAM990 host target gene. DSCR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR1 BINDING SITE, designated SEQ ID:10676, to the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, also designated SEQ ID:3701.

[36688] A function of VGAM990 is therefore inhibition of Down Syndrome Critical Region Gene 1 (DSCR1, Accession NM_004414), a gene which inhibits calcineurin-dependent transcriptional responses. Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR1.

The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM589. Epithelial Membrane Protein 1 (EMP1, Accession NM_001423) is another VGAM990 host target gene. EMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMP1 BINDING SITE, designated SEQ ID:7136, to the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, also designated SEQ ID:3701.

[36689] Another function of VGAM990 is therefore inhibition of Epithelial Membrane Protein 1 (EMP1, Accession NM_001423), a gene which plays a role in squamous cell differentiation; member of the PMP22/EMP/MP20 family of membrane glycoproteins. Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMP1. The function of EMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM107.Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563) is another VGAM990 host target gene. SEDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE, designated SEQ ID:15914, to the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, also designated SEQ ID:3701.

[36690] Another function of VGAM990 is therefore inhibition of Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEDL. The function of SEDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Zinc Finger Protein 22 (KOX 15) (ZNF22, Accession XM_166153) is another VGAM990 host target gene. ZNF22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by ZNF22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF22 BINDING SITE, designated SEQ ID:43970, to the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, also designated SEQ ID:3701.

[36691] Another function of VGAM990 is therefore inhibition of Zinc Finger Protein 22 (KOX 15) (ZNF22, Accession XM_166153). Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF22. ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726) is another VGAM990 host target gene. ABCC13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCC13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC13 BINDING SITE, designated SEQ ID:28972, to the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, also designated SEQ ID:3701.

[36692] Another function of VGAM990 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726). Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC13. FLJ20308 (Accession XM_039852) is another VGAM990 host target gene. FLJ20308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20308 BINDING SITE, designated SEQ ID:33199, to the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, also designated SEQ ID:3701.

[36693] Another function of VGAM990 is therefore inhibition of FLJ20308 (Accession XM_039852). Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20308. KIAA1511 (Accession XM_046581) is another VGAM990 host target gene. KIAA1511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1511, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1511 BINDING SITE, designated SEQ ID:34756, to the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, also designated SEQ ID:3701.

[36694] Another function of VGAM990 is therefore inhibition of KIAA1511 (Accession XM_046581). Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1511. MGC23980 (Accession NM_145005) is another VGAM990 host target gene. MGC23980 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC23980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC23980 BINDING SITE, designated SEQ ID:29606, to the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, also designated SEQ ID:3701.

[36695] Another function of VGAM990 is therefore inhibition of MGC23980 (Accession NM_145005). Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC23980. WSB1 (Accession NM_134264) is another VGAM990 host target gene. WSB1 BINDING SITE1 and WSB1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WSB1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WSB1 BINDING SITE1 and WSB1 BINDING SITE2, designated SEQ ID:28616 and SEQ ID:28622 respectively, to the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, also designated SEQ ID:3701.

[36696] Another function of VGAM990 is therefore inhibition of WSB1 (Accession NM_134264). Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WSB1. LOC154043 (Accession XM_087831) is another VGAM990 host target gene. LOC154043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154043 BINDING

SITE, designated SEQ ID:39460, to the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, also designated SEQ ID:3701.

[36697] Another function of VGAM990 is therefore inhibition of LOC154043 (Accession XM_087831). Accordingly, utilities of VGAM990 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154043. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 991 (VGAM991) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36698] VGAM991 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM991 was detected is described hereinabove with reference to Figs. 1–8.

[36699] VGAM991 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–1. VGAM991 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36700] VGAM991 gene encodes a VGAM991 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM991 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM991 precursor RNA is designated SEQ ID:977, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:977 is located at position 390 relative to the genome of Leishmania RNA Virus 1-1.

[36701] VGAM991 precursor RNA folds onto itself, forming VGAM991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36702] An enzyme complex designated DICER COMPLEX, `dices` the VGAM991 folded precursor RNA into VGAM991 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM991 RNA is designated SEQ ID:3702, and is provided hereinbelow with reference to the sequence listing part.

[36703] VGAM991 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM991 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM991 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36704] VGAM991 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM991 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM991 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM991 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM991 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[36705] The complementary binding of VGAM991 RNA, herein designated VGAM RNA, to host target binding sites on VGAM991 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM991 host target RNA into VGAM991 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36706] It is appreciated that VGAM991 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM991 host target genes. The mRNA of each one of this plurality of VGAM991 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM991 RNA, herein designated VGAM RNA, and which when bound by VGAM991 RNA causes inhibition of translation of respective one or more VGAM991 host target proteins.

[36707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM991 gene, herein designated VGAM GENE, on one or more VGAM991 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[36708] It is yet further appreciated that a function of VGAM991 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1-1. Specific functions, and accordingly utilities, of VGAM991 correlate with, and may be deduced from, the identity of the host target genes which VGAM991 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36709] Nucleotide sequences of the VGAM991 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM991 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM991 are further described hereinbelow with reference to Table 1.

[36710] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM991 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM991 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36711] As mentioned hereinabove with reference to Fig. 1, a function of VGAM991 gene, herein designated VGAM is inhibition of expression of VGAM991 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM991 correlate with, and may be deduced from, the identity of the target genes which VGAM991 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36712] Anterior Gradient 2 Homolog (*Xenopus laevis*) (AGR2, Accession NM_006408) is a VGAM991 host target gene. AGR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AGR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGR2 BINDING SITE, designated SEQ ID:13113, to the nucleotide sequence of VGAM991 RNA, herein designated VGAM RNA, also designated SEQ ID:3702.

[36713] A function of VGAM991 is therefore inhibition of Anterior

Gradient 2 Homolog (*Xenopus laevis*) (AGR2, Accession NM_006408), a gene which Expressed in estrogen receptor-positive breast cancer cell lines. Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGR2. The function of AGR2 has been established by previous studies. Estrogen receptor (ER; 133430)-negative breast cancers are less well-differentiated and more aggressive than ER-positive tumors. Using suppression subtractive hybridization, Kuang et al. (1998) identified 29 gene fragments expressed in ER-positive breast carcinomas that might contribute to its less aggressive phenotype compared to ER-negative tumors. The expression of one of these fragments, DEME2, correlated with ER expression in 8 breast carcinoma cell lines. By screening an ER-positive breast cancer cDNA library with the DEKE2 fragment, followed by EST database searching, Thompson and Weigel (1998) obtained a cDNA encoding AGR2, a homolog of the frog secreted cement gland anterior gradient protein, which they termed AG2. The deduced 175-amino acid soluble AGR2 protein, which is 91% identical to the mouse protein and 47% identical to the frog protein, contains a signal peptide. Northern blot analysis revealed strongest

expression of 0.9– and 1.6–kb AGR2 transcripts in lung and in all ER–positive breast carcinoma lines tested; weaker expression was detected in pancreas. RNA dot blot analysis detected strong expression in trachea, lung, stomach, colon, prostate, and small intestine, with lower expression in other tissues. By radiation hybrid analysis and FISH, Petek et al. (2000) mapped the AGR2 gene to 7p21.3.

[36714] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[36715] Petek, E.; Windpassinger, C.; Egger, H.; Kroisel, P. M.; Wagner, K. : Localization of the human anterior gradient–2 gene (AGR2) to chromosome band 7p21.3 by radiation hybrid mapping and fluorescence in situ hybridisation. *Cytogenet. Cell Genet.* 89: 141–142, 2000. ; and

[36716] Thompson, D. A.; Weigel, R. J. : hAG–2, the human homologue of the *Xenopus laevis* cement gland gene XAG–2, is coexpressed with estrogen receptor in breast cancer cell lines. *Biochem. B.*

[36717] Further studies establishing the function and utilities of AGR2 are found in John Hopkins OMIM database record ID 606358, and in cited publications numbered 6420–6173

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 12 (potassium/chloride transporters), Member 7 (SLC12A7, Accession NM_006598) is another VGAM991 host target gene. SLC12A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC12A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A7 BINDING SITE, designated SEQ ID:13374, to the nucleotide sequence of VGAM991 RNA, herein designated VGAM RNA, also designated SEQ ID:3702.

[36718] Another function of VGAM991 is therefore inhibition of Solute Carrier Family 12 (potassium/chloride transporters), Member 7 (SLC12A7, Accession NM_006598), a gene which is a potassium/chloride-cotransporter. Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A7. The function of SLC12A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.CLIPR-59

(Accession NM_015526) is another VGAM991 host target gene. CLIPR-59 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLIPR-59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIPR-59 BINDING SITE, designated SEQ ID:17784, to the nucleotide sequence of VGAM991 RNA, herein designated VGAM RNA, also designated SEQ ID:3702.

[36719] Another function of VGAM991 is therefore inhibition of CLIPR-59 (Accession NM_015526). Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIPR-59. DCNP1 (Accession NM_130848) is another VGAM991 host target gene. DCNP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCNP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCNP1 BINDING SITE, designated SEQ ID:28386, to the nucleotide sequence of VGAM991 RNA, herein designated VGAM RNA, also designated SEQ

ID:3702.

[36720] Another function of VGAM991 is therefore inhibition of DCNP1 (Accession NM_130848). Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCNP1. FLJ12875 (Accession NM_024544) is another VGAM991 host target gene. FLJ12875 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12875, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12875 BINDING SITE, designated SEQ ID:23753, to the nucleotide sequence of VGAM991 RNA, herein designated VGAM RNA, also designated SEQ ID:3702.

[36721] Another function of VGAM991 is therefore inhibition of FLJ12875 (Accession NM_024544). Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12875. KIAA0323 (Accession XM_032634) is another VGAM991 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31686, to the nucleotide sequence of VGAM991 RNA, herein designated VGAM RNA, also designated SEQ ID:3702.

[36722] Another function of VGAM991 is therefore inhibition of KIAA0323 (Accession XM_032634). Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. LOC144308 (Accession XM_096575) is another VGAM991 host target gene. LOC144308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144308 BINDING SITE, designated SEQ ID:40404, to the nucleotide sequence of VGAM991 RNA, herein designated VGAM RNA, also designated SEQ ID:3702.

[36723] Another function of VGAM991 is therefore inhibition of LOC144308 (Accession XM_096575). Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC144308. LOC153480 (Accession XM_053483) is another VGAM991 host target gene. LOC153480 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153480, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153480 BINDING SITE, designated SEQ ID:36088, to the nucleotide sequence of VGAM991 RNA, herein designated VGAM RNA, also designated SEQ ID:3702.

[36724] Another function of VGAM991 is therefore inhibition of LOC153480 (Accession XM_053483). Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153480. LOC154739 (Accession XM_098602) is another VGAM991 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41722, to

the nucleotide sequence of VGAM991 RNA, herein designated VGAM RNA, also designated SEQ ID:3702.

[36725] Another function of VGAM991 is therefore inhibition of LOC154739 (Accession XM_098602). Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 992 (VGAM992) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36726] VGAM992 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM992 was detected is described hereinabove with reference to Figs. 1–8.

[36727] VGAM992 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–1. VGAM992 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36728] VGAM992 gene encodes a VGAM992 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM992 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM992 precursor RNA is designated SEQ ID:978, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:978 is located at position 3813 relative to the genome of Leishmania RNA Virus 1-1.

[36729] VGAM992 precursor RNA folds onto itself, forming VGAM992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36730] An enzyme complex designated DICER COMPLEX, `dices` the VGAM992 folded precursor RNA into VGAM992 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM992 RNA is designated SEQ ID:3703, and is provided hereinbelow with reference to the sequence listing part.

[36731] VGAM992 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM992 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM992 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36732] VGAM992 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM992 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM992 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM992 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM992 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36733] The complementary binding of VGAM992 RNA, herein designated VGAM RNA, to host target binding sites on VGAM992 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM992 host target RNA into VGAM992 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36734] It is appreciated that VGAM992 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM992 host target genes. The mRNA of each one of this plurality of VGAM992 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM992 RNA, herein designated VGAM RNA, and which when bound by VGAM992 RNA causes inhibition of translation of respective one or more VGAM992 host target proteins.

[36735] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM992 gene, herein designated VGAM GENE, on one or more VGAM992 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[36736] It is yet further appreciated that a function of VGAM992 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1-1. Specific functions, and accordingly utilities, of VGAM992 correlate with, and may be deduced from, the identity of the host target genes which VGAM992 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36737] Nucleotide sequences of the VGAM992 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM992 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM992 are further described hereinbelow with reference to Table 1.

[36738] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM992 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM992 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36739] As mentioned hereinabove with reference to Fig. 1, a function of VGAM992 gene, herein designated VGAM is inhibition of expression of VGAM992 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM992 correlate with, and may be deduced from, the identity of the target genes which VGAM992 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36740] EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838) is a VGAM992 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41879, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36741] A function of VGAM992 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838).

Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Leucine-rich Repeat-containing 2 (LRRC2, Accession NM_024512) is another VGAM992 host target gene. LRRC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRRC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRC2 BINDING SITE, designated SEQ ID:23703, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36742] Another function of VGAM992 is therefore inhibition of Leucine-rich Repeat-containing 2 (LRRC2, Accession NM_024512). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRC2. Zinc Finger Protein, Subfamily 2A (FYVE domain containing), 1 (ZNFN2A1, Accession XM_027302) is another VGAM992 host target gene. ZNFN2A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNFN2A1, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNFN2A1 BINDING SITE, designated SEQ ID:30468, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36743] Another function of VGAM992 is therefore inhibition of Zinc Finger Protein, Subfamily 2A (FYVE domain containing), 1 (ZNFN2A1, Accession XM_027302). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNFN2A1. Calsenilin, Presenilin Binding Protein, EF Hand Transcription Factor (CSEN, Accession NM_013434) is another VGAM992 host target gene. CSEN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSEN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSEN BINDING SITE, designated SEQ ID:15091, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36744] Another function of VGAM992 is therefore inhibition of

Calsenilin, Presenilin Binding Protein, EF Hand Transcription Factor (CSEN, Accession NM_013434). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSEN. Docking Protein 4 (DOK4, Accession NM_018110) is another VGAM992 host target gene. DOK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOK4 BINDING SITE, designated SEQ ID:19879, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36745] Another function of VGAM992 is therefore inhibition of Docking Protein 4 (DOK4, Accession NM_018110). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOK4. FLJ11800 (Accession NM_024974) is another VGAM992 host target gene. FLJ11800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11800, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11800 BINDING SITE, designated SEQ ID:24531, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36746] Another function of VGAM992 is therefore inhibition of FLJ11800 (Accession NM_024974). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11800. FLJ22341 (Accession NM_024599) is another VGAM992 host target gene. FLJ22341 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22341 BINDING SITE, designated SEQ ID:23847, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36747] Another function of VGAM992 is therefore inhibition of FLJ22341 (Accession NM_024599). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22341.

KIAA1950 (Accession XM_166532) is another VGAM992 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44487, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36748] Another function of VGAM992 is therefore inhibition of KIAA1950 (Accession XM_166532). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. MGC15631 (Accession NM_032753) is another VGAM992 host target gene. MGC15631 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15631 BINDING SITE, designated SEQ ID:26494, to the nucleotide sequence of VGAM992 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3703.

[36749] Another function of VGAM992 is therefore inhibition of MGC15631 (Accession NM_032753). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15631. PRO2133 (Accession NM_018619) is another VGAM992 host target gene. PRO2133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2133 BINDING SITE, designated SEQ ID:20693, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36750] Another function of VGAM992 is therefore inhibition of PRO2133 (Accession NM_018619). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2133. Sialyltransferase 4A (beta-galactoside alpha-2,3-sialyltransferase) (SIAT4A, Accession NM_003033) is another VGAM992 host target gene. SIAT4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SIAT4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT4A BINDING SITE, designated SEQ ID:8979, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36751] Another function of VGAM992 is therefore inhibition of Sialyltransferase 4A (beta-galactoside alpha-2,3-sialyltransferase) (SIAT4A, Accession NM_003033). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT4A. Stromal Antigen 3 (STAG3, Accession NM_012447) is another VGAM992 host target gene. STAG3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STAG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAG3 BINDING SITE, designated SEQ ID:14819, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36752] Another function of VGAM992 is therefore inhibition of Stromal Antigen 3 (STAG3, Accession NM_012447). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAG3. Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM_014820) is another VGAM992 host target gene. TOMM70A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOMM70A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOMM70A BINDING SITE, designated SEQ ID:16789, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36753] Another function of VGAM992 is therefore inhibition of Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM_014820). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOMM70A. LOC138241 (Accession XM_059957) is another VGAM992 host target gene.

LOC138241 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138241 BINDING SITE, designated SEQ ID:37120, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36754] Another function of VGAM992 is therefore inhibition of LOC138241 (Accession XM_059957). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138241. LOC144848 (Accession XM_056770) is another VGAM992 host target gene. LOC144848 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144848 BINDING SITE, designated SEQ ID:36420, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36755] Another function of VGAM992 is therefore inhibition of LOC144848 (Accession XM_056770). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144848. LOC170395 (Accession XM_084325) is another VGAM992 host target gene. LOC170395 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170395 BINDING SITE, designated SEQ ID:37544, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36756] Another function of VGAM992 is therefore inhibition of LOC170395 (Accession XM_084325). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170395. LOC220575 (Accession XM_083991) is another VGAM992 host target gene. LOC220575 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220575, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220575 BINDING SITE, designated SEQ ID:37529, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36757] Another function of VGAM992 is therefore inhibition of LOC220575 (Accession XM_083991). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220575. LOC254181 (Accession XM_174526) is another VGAM992 host target gene. LOC254181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254181 BINDING SITE, designated SEQ ID:46597, to the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, also designated SEQ ID:3703.

[36758] Another function of VGAM992 is therefore inhibition of LOC254181 (Accession XM_174526). Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254181. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 993 (VGAM993) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36759] VGAM993 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM993 was detected is described hereinabove with reference to Figs. 1–8.

[36760] VGAM993 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–1. VGAM993 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36761] VGAM993 gene encodes a VGAM993 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM993 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM993 precursor RNA is designated SEQ ID:979, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:979 is located at position 4662 relative to the genome of Leishmania RNA Virus 1-1.

[36762] VGAM993 precursor RNA folds onto itself, forming VGAM993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36763] An enzyme complex designated DICER COMPLEX, `dices` the VGAM993 folded precursor RNA into VGAM993 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM993 RNA is designated SEQ ID:3704, and is provided hereinbelow with reference to the sequence listing part.

[36764] VGAM993 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM993 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM993 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36765] VGAM993 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM993 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM993 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM993 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM993 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36766] The complementary binding of VGAM993 RNA, herein designated VGAM RNA, to host target binding sites on VGAM993 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM993 host target RNA into VGAM993 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36767] It is appreciated that VGAM993 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM993 host target genes. The mRNA of each one of this plurality of VGAM993 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM993 RNA, herein designated VGAM RNA, and which when bound by VGAM993 RNA causes in-

hibition of translation of respective one or more VGAM993 host target proteins.

[36768] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM993 gene, herein designated VGAM GENE, on one or more VGAM993 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36769] It is yet further appreciated that a function of VGAM993 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM993 include diagnosis, prevention and

treatment of viral infection by Leishmania RNA Virus 1-1. Specific functions, and accordingly utilities, of VGAM993 correlate with, and may be deduced from, the identity of the host target genes which VGAM993 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36770] Nucleotide sequences of the VGAM993 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM993 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM993 are further described hereinbelow with reference to Table 1.

[36771] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM993 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM993 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36772] As mentioned hereinabove with reference to Fig. 1, a function of VGAM993 gene, herein designated VGAM is inhibition of expression of VGAM993 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM993 correlate with, and may be deduced from, the identity of the target genes which VGAM993 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36773] Exostoses (multiple)-like 1 (EXTL1, Accession NM_004455) is a VGAM993 host target gene. EXTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL1 BINDING SITE, designated SEQ ID:10751, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36774] A function of VGAM993 is therefore inhibition of Exostoses (multiple)-like 1 (EXTL1, Accession NM_004455), a gene which probably contribute to the synthesis of heparan sulfate and heparin. Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL1. The function of EXTL1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM806. Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823) is another VGAM993 host target gene. PKIA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PKIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKIA BINDING SITE, designated SEQ ID:13699, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36775] Another function of VGAM993 is therefore inhibition of Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823). Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIA. PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_015866) is another VGAM993 host target gene. PRDM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:18005, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36776] Another function of VGAM993 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_015866), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. RAP1A, Member of RAS Oncogene Family (RAP1A, Accession NM_002884) is another VGAM993 host target gene. RAP1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP1A BINDING SITE, designated SEQ

ID:8794, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36777] Another function of VGAM993 is therefore inhibition of RAP1A, Member of RAS Oncogene Family (RAP1A, Accession NM_002884), a gene which induces morphological reversion of a cell line transformed by a ras oncogene. Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1A. The function of RAP1A has been established by previous studies. Three human cDNAs encoding 'new' RAS-related proteins, designated RAP1A, RAP1B, and RAP2, were isolated by Pizon et al. (1988). These proteins share approximately 50% amino acid identity with the classical RAS proteins and have numerous structural features in common. The most striking difference between the RAP and RAS proteins resides in their 61st amino acid: glutamine in RAS is replaced by threonine in RAP proteins. Animal model experiments lend further support to the function of RAP1A. Using mice transgenic for constitutive expression of Rap1a within the T cell lineage, Sebzda et al. (2002) found that instead of anergy, these T cells showed enhanced T cell receptor-me-

diated responses, both in thymocytes and in mature T cells. In addition, Rap1a activation induces strong activation of beta-1 (OMIM Ref. No. 135630) and beta-2 (OMIM Ref. No. 600065) integrins. The authors concluded that Rap1a positively influences T cells by augmenting their responses and directing integrin activation.

[36778] It is appreciated that the abovementioned animal model for RAP1A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[36779] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[36780] Pizon, V.; Chardin, P.; Lerosey, I.; Olofsson, B.; Tavitian, A. : Human cDNAs RAP1 and RAP2 homologous to the Drosophila gene Dras3 encode proteins closely related to ras in the 'effector' region. *Oncogene* 3: 201-204, 1988. ; and

[36781] Kitayama, H.; Sugimoto, Y.; Matsuzaki, T.; Ikawa, Y.; Noda, M. : A ras-related gene with transformation suppressor activity. *Cell* 56: 77-84, 1989. PubMed ID : 2642744 9. Sebzda, E.; Brac.

[36782] Further studies establishing the function and utilities of

RAP1A are found in John Hopkins OMIM database record ID 179520, and in cited publications numbered 2547–2550, 1184, 488 and 12377–12381 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 28 (DDX28, Accession NM_018380) is another VGAM993 host target gene. DDX28 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DDX28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX28 BINDING SITE, designated SEQ ID:20408, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36783] Another function of VGAM993 is therefore inhibition of DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 28 (DDX28, Accession NM_018380). Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX28. Potassium Voltage–gated Channel, Shal–related Subfamily, Member 1 (KCND1, Accession NM_004979) is another VGAM993 host target gene. KCND1 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by KCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND1 BINDING SITE, designated SEQ ID:11424, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36784] Another function of VGAM993 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM_004979). Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND1. MGC13251 (Accession NM_032714) is another VGAM993 host target gene. MGC13251 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13251 BINDING SITE, designated SEQ ID:26436, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36785] Another function of VGAM993 is therefore inhibition of MGC13251 (Accession NM_032714). Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13251. Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202) is another VGAM993 host target gene. SS18L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SS18L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18L1 BINDING SITE, designated SEQ ID:32558, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36786] Another function of VGAM993 is therefore inhibition of Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202). Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18L1. LOC124460 (Accession XM_071892) is another VGAM993 host target gene. LOC124460 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC124460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124460 BINDING SITE, designated SEQ ID:37445, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36787] Another function of VGAM993 is therefore inhibition of LOC124460 (Accession XM_071892). Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124460. LOC138130 (Accession XM_070771) is another VGAM993 host target gene. LOC138130 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC138130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138130 BINDING SITE, designated SEQ ID:37394, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36788] Another function of VGAM993 is therefore inhibition of LOC138130 (Accession XM_070771). Accordingly, utilities

of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138130. LOC152620 (Accession XM_011108) is another VGAM993 host target gene. LOC152620 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152620 BINDING SITE, designated SEQ ID:30173, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36789] Another function of VGAM993 is therefore inhibition of LOC152620 (Accession XM_011108). Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152620. LOC158668 (Accession XM_045161) is another VGAM993 host target gene. LOC158668 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC158668 BINDING SITE, designated SEQ ID:34377, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36790] Another function of VGAM993 is therefore inhibition of LOC158668 (Accession XM_045161). Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158668. LOC254312 (Accession XM_172839) is another VGAM993 host target gene. LOC254312 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254312 BINDING SITE, designated SEQ ID:46113, to the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, also designated SEQ ID:3704.

[36791] Another function of VGAM993 is therefore inhibition of LOC254312 (Accession XM_172839). Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254312. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 994 (VGAM994) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36792] VGAM994 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM994 was detected is described hereinabove with reference to Figs. 1–8.

[36793] VGAM994 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–1. VGAM994 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36794] VGAM994 gene encodes a VGAM994 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM994 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM994 precursor RNA is designated SEQ ID:980, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:980 is located at position 4299 relative to the genome of Leish-

mania RNA Virus 1-1.

[36795] VGAM994 precursor RNA folds onto itself, forming VGAM994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36796] An enzyme complex designated DICER COMPLEX, `dices` the VGAM994 folded precursor RNA into VGAM994 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM994 RNA is designated SEQ ID:3705, and is provided hereinbelow with reference to the sequence listing part.

[36797] VGAM994 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM994 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM994 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36798] VGAM994 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM994 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM994 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM994 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM994 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36799] The complementary binding of VGAM994 RNA, herein designated VGAM RNA, to host target binding sites on VGAM994 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM994 host target RNA into VGAM994 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36800] It is appreciated that VGAM994 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM994 host target genes. The mRNA of each one of this plurality of VGAM994 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM994 RNA, herein designated VGAM RNA, and which when bound by VGAM994 RNA causes inhibition of translation of respective one or more VGAM994 host target proteins.

[36801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM994 gene, herein designated VGAM GENE, on one or more VGAM994 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36802] It is yet further appreciated that a function of VGAM994 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM994 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1-1. Specific functions, and accordingly utilities, of VGAM994

correlate with, and may be deduced from, the identity of the host target genes which VGAM994 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36803] Nucleotide sequences of the VGAM994 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM994 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM994 are further described hereinbelow with reference to Table 1.

[36804] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM994 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM994 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36805] As mentioned hereinabove with reference to Fig. 1, a function of VGAM994 gene, herein designated VGAM is inhibition of expression of VGAM994 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM994 correlate with, and may be deduced

from, the identity of the target genes which VGAM994 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36806] Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193) is a VGAM994 host target gene. FZD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:14489, to the nucleotide sequence of VGAM994 RNA, herein designated VGAM RNA, also designated SEQ ID:3705.

[36807] A function of VGAM994 is therefore inhibition of Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains. Accordingly, utilities of VGAM994 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD4. The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM309.Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983) is another VGAM994 host target gene.

SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:10131, to the nucleotide sequence of VGAM994 RNA, herein designated VGAM RNA, also designated SEQ ID:3705.

[36808] Another function of VGAM994 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM994 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM87.FLJ10932 (Accession NM_018277) is another VGAM994 host target

gene. FLJ10932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10932 BINDING SITE, designated SEQ ID:20264, to the nucleotide sequence of VGAM994 RNA, herein designated VGAM RNA, also designated SEQ ID:3705.

[36809] Another function of VGAM994 is therefore inhibition of FLJ10932 (Accession NM_018277). Accordingly, utilities of VGAM994 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10932. KIAA1906 (Accession XM_055095) is another VGAM994 host target gene. KIAA1906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1906 BINDING SITE, designated SEQ ID:36230, to the nucleotide sequence of VGAM994 RNA, herein designated VGAM RNA, also designated SEQ ID:3705.

[36810] Another function of VGAM994 is therefore inhibition of KIAA1906 (Accession XM_055095). Accordingly, utilities of VGAM994 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1906. LOC126917 (Accession XM_059091) is another VGAM994 host target gene. LOC126917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126917 BINDING SITE, designated SEQ ID:36870, to the nucleotide sequence of VGAM994 RNA, herein designated VGAM RNA, also designated SEQ ID:3705.

[36811] Another function of VGAM994 is therefore inhibition of LOC126917 (Accession XM_059091). Accordingly, utilities of VGAM994 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126917. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 995 (VGAM995) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[36812] VGAM995 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM995 was detected is described hereinabove with reference to Figs. 1–8.

[36813] VGAM995 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–1. VGAM995 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36814] VGAM995 gene encodes a VGAM995 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM995 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM995 precursor RNA is designated SEQ ID:981, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:981 is located at position 4489 relative to the genome of Leishmania RNA Virus 1–1.

[36815] VGAM995 precursor RNA folds onto itself, forming VGAM995 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[36816] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM995 folded precursor RNA into VGAM995 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 43%) nucleotide se-
quence of VGAM995 RNA is designated SEQ ID:3706, and
is provided hereinbelow with reference to the sequence
listing part.

[36817] VGAM995 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM995 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM995 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36818] VGAM995 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM995 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM995 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM995 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM995 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36819] The complementary binding of VGAM995 RNA, herein designated VGAM RNA, to host target binding sites on VGAM995 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM995 host target RNA into VGAM995 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36820] It is appreciated that VGAM995 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM995 host target genes. The mRNA of each one of this plurality of VGAM995 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM995 RNA, herein designated VGAM RNA, and which when bound by VGAM995 RNA causes inhibition of translation of respective one or more VGAM995 host target proteins.

[36821] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM995 gene, herein designated VGAM GENE, on one or more VGAM995 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36822] It is yet further appreciated that a function of VGAM995 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1-1. Specific functions, and accordingly utilities, of VGAM995 correlate with, and may be deduced from, the identity of the host target genes which VGAM995 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [36823] Nucleotide sequences of the VGAM995 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM995 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM995 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM995 are further described hereinbelow with reference to Table 1.
- [36824] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM995 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM995 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [36825] As mentioned hereinabove with reference to Fig. 1, a function of VGAM995 gene, herein designated VGAM is inhibition of expression of VGAM995 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM995 correlate with, and may be deduced from, the identity of the target genes which VGAM995 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36826] Aryl Hydrocarbon Receptor (AHR, Accession NM_001621) is a VGAM995 host target gene. AHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:7335, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36827] A function of VGAM995 is therefore inhibition of Aryl Hydrocarbon Receptor (AHR, Accession NM_001621), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic-metabolizing enzymes. Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHR. The function of AHR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM368.ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933) is another VGAM995 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32509, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36828] Another function of VGAM995 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633) is another VGAM995 host target gene. BCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6262, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36829] Another function of VGAM995 is therefore inhibition of B-

cell CLL/lymphoma 2 (BCL2, Accession NM_000633). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. Calcitonin Receptor-like (CALCRL, Accession NM_005795) is another VGAM995 host target gene. CALCRL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALCRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALCRL BINDING SITE, designated SEQ ID:12376, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36830] Another function of VGAM995 is therefore inhibition of Calcitonin Receptor-like (CALCRL, Accession NM_005795), a gene which is a receptor for calcitonin gene-related peptide type 1. Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALCRL. The function of CALCRL has been established by previous studies. McLatchie et al. (1998) demonstrated that a complex consisting of RAMP2 and CALCRL can function as an ADM re-

ceptor. To investigate whether ADM has implications as a pathophysiologic substance in pregnancy-induced hypertension, Makino et al. (2001) measured the changes of expression of RAMP2 and CALCRL in fetomaternal tissues in normotensive pregnant women and pregnancy-induced hypertensive women by Northern blot analysis. RAMP2 and CALCRL mRNA was significantly decreased in the umbilical artery and uterus of the patients with pregnancy-induced hypertension. On the other hand, RAMP2 mRNA was significantly increased in the fetal membrane of the patients with pregnancy-induced hypertension. In addition, there was a significant negative correlation between the RAMP2 mRNA levels in the umbilical artery and uterine muscle and blood pressure. However, there was no correlation between the mRNA level and blood pressure in fetal membrane and placenta, suggesting that there is no close relationship to the pathogenesis in pregnancy-induced hypertension. These findings suggested that the reduced expression of RAMP2 and CALCRL functioning as components of an adrenomedullin receptor in umbilical artery and uterus may have some role in pregnancy-induced hypertension. In a mammalian cell line without an endogenous receptor, McLatchie et al. (1998) observed increased

intracellular cAMP levels in response to CGRP when CGRPR and receptor activity-modifying protein-1 (RAMP1; 605153) were expressed together, but not when they were expressed alone. Flow cytometric analysis showed that expression of CGRPR at the cell surface increases substantially when CGRPR is expressed with RAMP1. Likewise, surface expression of RAMP1 was shown to increase in cells also expressing CGRPR. SDS-PAGE analysis showed that binding of CGRP requires expression of both the 14-kD RAMP1 and the 58-kD CGRPR glycoprotein. The authors demonstrated that in the presence of RAMP1, CGRPR becomes a 66-kD terminally glycosylated protein. McLatchie et al. (1998) found that unlike RAMP1, RAMP2 (OMIM Ref. No. 605154) and RAMP3 (OMIM Ref. No. 605155) do not potentiate responses to CGRP but do transport the glycosylated 58-kD but not the 66-kD form of CGRPR to the cell surface. In frog oocytes and mammalian cells, coexpression of RAMP2 and CGRPR resulted in increased intracellular cAMP concentrations in response to ADM but not to CGRP, CT, or IAPP. SDS-PAGE analysis demonstrated that ADM binds to coexpressed RAMP2 and CGRPR. McLatchie et al. (1998) demonstrated that a complex consisting of RAMP2 and CALCRL can function as an

ADM receptor. To investigate whether ADM has implications as a pathophysiologic substance in pregnancy-induced hypertension, Makino et al. (2001) measured the changes of expression of RAMP2 and CALCRL in fetomaternal tissues in normotensive pregnant women and pregnancy-induced hypertensive women by Northern blot analysis. RAMP2 and CALCRL mRNA was significantly decreased in the umbilical artery and uterus of the patients with pregnancy-induced hypertension. On the other hand, RAMP2 mRNA was significantly increased in the fetal membrane of the patients with pregnancy-induced hypertension. In addition, there was a significant negative correlation between the RAMP2 mRNA levels in the umbilical artery and uterine muscle and blood pressure. However, there was no correlation between the mRNA level and blood pressure in fetal membrane and placenta, suggesting that there is no close relationship to the pathogenesis in pregnancy-induced hypertension. These findings suggested that the reduced expression of RAMP2 and CALCRL functioning as components of an adrenomedullin receptor in umbilical artery and uterus may have some role in pregnancy-induced hypertension.

[36831] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [36832] McLatchie, L. M.; Fraser, N. J.; Main, M. J.; Wise, A.; Brown, J.; Thompson, N.; Solari, R.; Lee, M. G.; Foord, S. M. : RAMPs regulate the transport and ligand specificity of the calcitonin–receptor–like receptor. *Nature* 393: 333–339, 1998. ; and
- [36833] Makino, Y.; Shibata, K.; Makino, I.; Kangawa, K.; Kawarabayashi, T. : Alteration of the adrenomedullin receptor components gene expression associated with the blood pressure in pregnancy.
- [36834] Further studies establishing the function and utilities of CALCRL are found in John Hopkins OMIM database record ID 114190, and in cited publications numbered 4693–4697, 4301–430 and 4698 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calpain 10 (CAPN10, Accession NM_023088) is another VGAM995 host target gene. CAPN10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAPN10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CAPN10 BINDING SITE, designated SEQ ID:23355, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36835] Another function of VGAM995 is therefore inhibition of Calpain 10 (CAPN10, Accession NM_023088), a gene which catalyzes limited proteolysis of substrates involved in cytoskeletal remodelling and signal transduction. Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN10. The function of CAPN10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. CRACC (Accession NM_021181) is another VGAM995 host target gene. CRACC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRACC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRACC BINDING SITE, designated SEQ ID:22156, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ

ID:3706.

[36836] Another function of VGAM995 is therefore inhibition of CRACC (Accession NM_021181), a gene which may participate in adhesion reactions between T lymphocytes and accessory cells. Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRACC. The function of CRACC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM26. Fas (TNFRSF6)-associated Via Death Domain (FADD, Accession NM_003824) is another VGAM995 host target gene. FADD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FADD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FADD BINDING SITE, designated SEQ ID:9918, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36837] Another function of VGAM995 is therefore inhibition of Fas (TNFRSF6)-associated Via Death Domain (FADD, Accession NM_003824), a gene which may play an important

role in the proximal signal transduction of FAS. Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FADD. The function of FADD has been established by previous studies. FADD is a universal adapter protein in apoptosis that mediates signaling of all known death domain-containing members of the TNF receptor superfamily (Kabra et al., 2001). Animal model experiments lend further support to the function of FADD. Yeh et al. (1998) found that FAS (CD95), TNFR1, and death receptor 3 (OMIM Ref. No. 603366) did not induce apoptosis in FADD-deficient embryonic fibroblasts, whereas DR4, oncogenes E1A and c-myc (OMIM Ref. No. 190080), and chemotherapeutic agent adriamycin did. Mice with a deletion in the FADD gene did not survive beyond day 11.5 of embryogenesis; these mice showed signs of cardiac failure and abdominal hemorrhage. Chimeric embryos showing a high contribution of FADD-null mutant cells to the heart reproduced the phenotype of FADD-deficient mutants. Thus, not only death receptors but also receptors that couple to developmental programs may use FADD for signaling. Since FAS is necessary for homeostasis in the immune system, Zhang et al. (1998) investigated the ef-

fect of FADD deletion in lymphoid organs. Since FADD-null mice die in utero, they used FADD-null, RAG1 (OMIM Ref. No. 179615)-null chimeras in which all mature lymphocytes were derived from the FADD-null cells, as RAG1-null mice are not capable of producing B or T cells. FAS-induced apoptosis was completely blocked in thymocytes from the FADD-null mice, indicating that there are no redundant FAS apoptotic pathways. Although thymocyte subpopulations were apparently normal in newborn chimeras, the thymocytes decreased to undetectable levels as these mice age. Peripheral T cells were present in all older FADD-null chimeras, but activation-induced proliferation was impaired despite production of IL2 (OMIM Ref. No. 147680). These results and the similarities between FADD-null mice and mice lacking the beta-subunits of the IL2 receptor (IL2RB; 146710), suggested to Zhang et al. (1998) that there is an unexpected connection between cell proliferation and apoptosis.

[36838] It is appreciated that the abovementioned animal model for FADD is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[36839] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [36840] Chinnaiyan, A. M.; O'Rourke, K.; Tewari, M.; Dixit, V. M. : FADD, a novel death domain-containing protein, interacts with the death domain of Fas and initiates apoptosis. *Cell* 81: 505–512, 1995. ; and
- [36841] Zhang, J.; Cado, D.; Chen, A.; Kabra, N. H.; Winoto, A. : Fas-mediated apoptosis and activation-induced T-cell proliferation are defective in mice lacking FADD/Mort1. *Nature* 392: 296–300.
- [36842] Further studies establishing the function and utilities of FADD are found in John Hopkins OMIM database record ID 602457, and in cited publications numbered 6325–6326, 596 and 6184–6185 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Insulin-like Growth Factor 2 Receptor (IGF2R, Accession NM_000876) is another VGAM995 host target gene. IGF2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGF2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF2R BINDING SITE, designated SEQ ID:6558,

to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36843] Another function of VGAM995 is therefore inhibition of Insulin-like Growth Factor 2 Receptor (IGF2R, Accession NM_000876), a gene which transport of phosphorylated lysosomal enzymes from the golgi complex and the cell surface to lysosomes. lysosomal enzymes bearing phosphomannosyl residues bind specifically to mannose-6-phosphate receptors in the golgi apparatus and the resulting receptor-ligand complex is transported to an acidic prelysosomal compartment where the low ph mediates the dissociation of the complex. this receptor also binds insulin growth factor ii. Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF2R. The function of IGF2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM209. Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM_014622) is another VGAM995 host target gene. LOH11CR2A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOH11CR2A, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOH11CR2A BINDING SITE, designated SEQ ID:15986, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36844] Another function of VGAM995 is therefore inhibition of Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM_014622). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOH11CR2A. Snail Homolog 1 (Drosophila) (SNAI1, Accession NM_005985) is another VGAM995 host target gene. SNAI1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAI1 BINDING SITE, designated SEQ ID:12606, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36845] Another function of VGAM995 is therefore inhibition of Snail Homolog 1 (Drosophila) (SNAI1, Accession

NM_005985). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAI1. Sulfotransferase Family, Cytosolic, 1A, Phenol-preferring, Member 2 (SULT1A2, Accession XM_051068) is another VGAM995 host target gene. SULT1A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SULT1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1A2 BINDING SITE, designated SEQ ID:35734, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36846] Another function of VGAM995 is therefore inhibition of Sulfotransferase Family, Cytosolic, 1A, Phenol-preferring, Member 2 (SULT1A2, Accession XM_051068), a gene which catalyzes the sulfate conjugation of target proteins and mediates the metabolic activation of carcinogenic n-hydroxyarylamines. Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1A2. The function of SULT1A2 has been established by previous studies.

Sulfonation is an important pathway in the biotransformation of many drugs, xenobiotics, neurotransmitters, and steroid hormones. The thermostable form of phenol sulfotransferase preferentially catalyzes the sulfonation of 'simple' planar phenols. The phenol sulfotransferase STP1 (OMIM Ref. No. 171150) maps to chromosome 16. Her et al. (1996) determined the structure and chromosomal localization of the gene encoding a second phenol sulfotransferase, STP2. The gene spans approximately 5.1 kb and contains 9 exons that range in length from 74 to 347 bp. The locations of most STP2 exon/intron splice junctions are identical to those of a gene for the thermolabile form of PST in humans, STM (OMIM Ref. No. 600641), which maps to 16p close to the location of the thermostable STP1. Her et al. (1996) mapped STP2 to human chromosome 16 by PCR with DNA from human/rodent somatic cell hybrids. Dooley and Huang (1996) determined the genomic organization of the human STP1, STP2, and STM (OMIM Ref. No. 600641) genes. These 3 genes each have 8 exons with the initiator methionine on exon 2. All 3 colocalize on a single cosmid from chromosome 16p12.1–p11.2 and have a high degree of sequence homology, suggesting that these 3 genes arose by gene du-

plication. Dooley and Huang (1996) stated that the previously identified PST gene sequences HAST4, HAST4v, and ST1A2 are isolates of the STP2 gene.

[36847] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[36848] Dooley, T. P.; Huang, Z. : Genomic organization and DNA sequences of two human phenol sulfotransferase genes (STP1 and STP2) on the short arm of chromosome 16. Biochem. Biophys. Res. Commun. 228: 134–140, 1996. ; and

[36849] Her, C.; Raftogianis, R.; Weinshilboum, R. M. : Human phenol sulfotransferase STP2 gene: molecular cloning, structural characterization, and chromosomal localization. Genomics 33: 409–4.

[36850] Further studies establishing the function and utilities of SULT1A2 are found in John Hopkins OMIM database record ID 601292, and in cited publications numbered 5264–5265 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ankyrin Repeat and SOCS Box–containing 13 (ASB13, Accession NM_024701) is another VGAM995 host target gene. ASB13 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by ASB13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASB13 BINDING SITE, designated SEQ ID:24012, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36851] Another function of VGAM995 is therefore inhibition of Ankyrin Repeat and SOCS Box-containing 13 (ASB13, Accession NM_024701). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB13. DKFZP434C1715 (Accession XM_098421) is another VGAM995 host target gene. DKFZP434C1715 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434C1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C1715 BINDING SITE, designated SEQ ID:41676, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ

ID:3706.

[36852] Another function of VGAM995 is therefore inhibition of DKFZP434C1715 (Accession XM_098421). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C1715. FLJ10604 (Accession NM_018154) is another VGAM995 host target gene. FLJ10604 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10604, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10604 BINDING SITE, designated SEQ ID:19964, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36853] Another function of VGAM995 is therefore inhibition of FLJ10604 (Accession NM_018154). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10604. FLJ10898 (Accession XM_002486) is another VGAM995 host target gene. FLJ10898 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10898, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE, designated SEQ ID:29889, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36854] Another function of VGAM995 is therefore inhibition of FLJ10898 (Accession XM_002486). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10898. KIAA0721 (Accession XM_171125) is another VGAM995 host target gene. KIAA0721 BINDING SITE1 and KIAA0721 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0721, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0721 BINDING SITE1 and KIAA0721 BINDING SITE2, designated SEQ ID:45925 and SEQ ID:22318 respectively, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36855] Another function of VGAM995 is therefore inhibition of KIAA0721 (Accession XM_171125). Accordingly, utilities

of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0721. KIAA1091 (Accession XM_045750) is another VGAM995 host target gene. KIAA1091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1091 BINDING SITE, designated SEQ ID:34539, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36856] Another function of VGAM995 is therefore inhibition of KIAA1091 (Accession XM_045750). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1091. MGC4266 (Accession NM_032680) is another VGAM995 host target gene. MGC4266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4266

BINDING SITE, designated SEQ ID:26401, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36857] Another function of VGAM995 is therefore inhibition of MGC4266 (Accession NM_032680). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4266. Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 12 (PSMD12, Accession NM_002816) is another VGAM995 host target gene. PSMD12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMD12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMD12 BINDING SITE, designated SEQ ID:8681, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36858] Another function of VGAM995 is therefore inhibition of Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 12 (PSMD12, Accession NM_002816). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with PSMD12. Regulatory Factor X, 4 (influences HLA class II expression) (RFX4, Accession NM_032491) is another VGAM995 host target gene. RFX4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RFX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX4 BINDING SITE, designated SEQ ID:26242, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36859] Another function of VGAM995 is therefore inhibition of Regulatory Factor X, 4 (influences HLA class II expression) (RFX4, Accession NM_032491). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX4. LOC118709 (Accession XM_058338) is another VGAM995 host target gene. LOC118709 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC118709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118709 BINDING

SITE, designated SEQ ID:36598, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36860] Another function of VGAM995 is therefore inhibition of LOC118709 (Accession XM_058338). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118709. LOC126669 (Accession XM_060121) is another VGAM995 host target gene. LOC126669 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:37159, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36861] Another function of VGAM995 is therefore inhibition of LOC126669 (Accession XM_060121). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669. LOC138241 (Accession XM_059957) is another VGAM995 host target gene. LOC138241 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138241 BINDING SITE, designated SEQ ID:37121, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36862] Another function of VGAM995 is therefore inhibition of LOC138241 (Accession XM_059957). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138241. LOC145900 (Accession XM_085276) is another VGAM995 host target gene. LOC145900 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145900 BINDING SITE, designated SEQ ID:38012, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36863] Another function of VGAM995 is therefore inhibition of

LOC145900 (Accession XM_085276). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145900. LOC149844 (Accession XM_086675) is another VGAM995 host target gene. LOC149844 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149844 BINDING SITE, designated SEQ ID:38823, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36864] Another function of VGAM995 is therefore inhibition of LOC149844 (Accession XM_086675). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149844. LOC151438 (Accession XM_098060) is another VGAM995 host target gene. LOC151438 BINDING SITE1 and LOC151438 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC151438, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151438 BINDING SITE1 and LOC151438 BINDING SITE2, designated SEQ ID:41346 and SEQ ID:41350 respectively, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36865] Another function of VGAM995 is therefore inhibition of LOC151438 (Accession XM_098060). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151438. LOC157376 (Accession XM_088301) is another VGAM995 host target gene. LOC157376 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157376 BINDING SITE, designated SEQ ID:39601, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36866] Another function of VGAM995 is therefore inhibition of LOC157376 (Accession XM_088301). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC157376. LOC197342 (Accession XM_113869) is another VGAM995 host target gene. LOC197342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:42489, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36867] Another function of VGAM995 is therefore inhibition of LOC197342 (Accession XM_113869). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197342. LOC203286 (Accession XM_117526) is another VGAM995 host target gene. LOC203286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203286 BINDING SITE, designated SEQ ID:43497, to

the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36868] Another function of VGAM995 is therefore inhibition of LOC203286 (Accession XM_117526). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203286. LOC222614 (Accession XM_169970) is another VGAM995 host target gene. LOC222614 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222614, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222614 BINDING SITE, designated SEQ ID:45306, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36869] Another function of VGAM995 is therefore inhibition of LOC222614 (Accession XM_169970). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222614. LOC253613 (Accession XM_171225) is another VGAM995 host target gene. LOC253613 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC253613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253613 BINDING SITE, designated SEQ ID:46013, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36870] Another function of VGAM995 is therefore inhibition of LOC253613 (Accession XM_171225). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253613. LOC254936 (Accession XM_170770) is another VGAM995 host target gene. LOC254936 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254936 BINDING SITE, designated SEQ ID:45527, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36871] Another function of VGAM995 is therefore inhibition of LOC254936 (Accession XM_170770). Accordingly, utilities

of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254936. LOC255870 (Accession XM_170628) is another VGAM995 host target gene. LOC255870 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255870 BINDING SITE, designated SEQ ID:45406, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36872] Another function of VGAM995 is therefore inhibition of LOC255870 (Accession XM_170628). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255870. LOC51336 (Accession NM_016646) is another VGAM995 host target gene. LOC51336 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC51336 BINDING SITE, designated SEQ ID:18753, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36873] Another function of VGAM995 is therefore inhibition of LOC51336 (Accession NM_016646). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336. LOC58486 (Accession NM_021211) is another VGAM995 host target gene. LOC58486 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC58486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58486 BINDING SITE, designated SEQ ID:22187, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36874] Another function of VGAM995 is therefore inhibition of LOC58486 (Accession NM_021211). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58486. LOC89135 (Accession XM_016232) is another VGAM995 host target gene. LOC89135 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89135 BINDING SITE, designated SEQ ID:30250, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36875] Another function of VGAM995 is therefore inhibition of LOC89135 (Accession XM_016232). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89135. LOC90538 (Accession XM_032401) is another VGAM995 host target gene. LOC90538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90538 BINDING SITE, designated SEQ ID:31658, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36876] Another function of VGAM995 is therefore inhibition of

LOC90538 (Accession XM_032401). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90538. LOC91974 (Accession XM_041974) is another VGAM995 host target gene. LOC91974 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91974, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91974 BINDING SITE, designated SEQ ID:33651, to the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, also designated SEQ ID:3706.

[36877] Another function of VGAM995 is therefore inhibition of LOC91974 (Accession XM_041974). Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91974. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 996 (VGAM996) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[36878] VGAM996 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM996 was detected is described hereinabove with reference to Figs. 1–8.

[36879] VGAM996 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–1. VGAM996 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36880] VGAM996 gene encodes a VGAM996 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM996 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM996 precursor RNA is designated SEQ ID:982, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:982 is located at position 3625 relative to the genome of Leishmania RNA Virus 1–1.

[36881] VGAM996 precursor RNA folds onto itself, forming VGAM996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[36882] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM996 folded precursor RNA into VGAM996 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 44%) nucleotide se-
quence of VGAM996 RNA is designated SEQ ID:3707, and
is provided hereinbelow with reference to the sequence
listing part.

[36883] VGAM996 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM996 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM996 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[36884] VGAM996 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM996 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM996 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM996 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM996 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5' UTR regions.

[36885] The complementary binding of VGAM996 RNA, herein designated VGAM RNA, to host target binding sites on VGAM996 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM996 host target RNA into VGAM996 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36886] It is appreciated that VGAM996 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM996 host target genes. The mRNA of each one of this plurality of VGAM996 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM996 RNA, herein designated VGAM RNA, and which when bound by VGAM996 RNA causes inhibition of translation of respective one or more VGAM996 host target proteins.

[36887] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM996 gene, herein designated VGAM GENE, on one or

more VGAM996 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36888] It is yet further appreciated that a function of VGAM996 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1-1. Specific functions, and accordingly utilities, of VGAM996 correlate with, and may be deduced from, the identity of the host target genes which VGAM996 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [36889] Nucleotide sequences of the VGAM996 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM996 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM996 are further described hereinbelow with reference to Table 1.
- [36890] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM996 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM996 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [36891] As mentioned hereinabove with reference to Fig. 1, a function of VGAM996 gene, herein designated VGAM is inhibition of expression of VGAM996 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM996 correlate with, and may be deduced from, the identity of the target genes which VGAM996 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [36892] V-raf Murine Sarcoma 3611 Viral Oncogene Homolog 1

(ARAF1, Accession XM_033884) is a VGAM996 host target gene. ARAF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARAF1 BINDING SITE, designated SEQ ID:31980, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36893] A function of VGAM996 is therefore inhibition of V-raf Murine Sarcoma 3611 Viral Oncogene Homolog 1 (ARAF1, Accession XM_033884), a gene which may play a critical role in cell growth and development. Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARAF1. The function of ARAF1 has been established by previous studies. By screening a mouse cDNA library with a v-raf oncogene probe, Huebner et al. (1986) also isolated a transforming raf-related cDNA, A-raf, that represented a gene distinct from RAF1. As an initial step in the analysis of this RAF1-related cDNA, they isolated a human ARAF cDNA and used it to map the genes in mouse and man.

The mouse gene cosegregated with the X chromosome in Chinese hamster–mouse hybrid cells. In humans, 2 independently segregating loci, designated ARAF1 and ARAF2, were mapped to chromosomes X and 7, respectively.

(Huebner et al. (1986) had not conclusively shown that the ARAF2 locus on chromosome 7 is transcribed, and indeed the ARAF2 locus, now designated ARAF2P, has been shown to be a pseudogene (Lee et al., 1994).) The single X-linked ARAF locus of the mouse and the ARAF1 locus of man are actively transcribed in several mouse and human cell lines. Because of an 80% homology to RAF1 in its kinase domain, the authors speculated that the ARAF1 gene product may have serine/threonine-specific kinase activity. By in situ hybridization, ARAF1 was mapped to Xp21–q11, probably Xp13–p11. Popescu and Mark (1989) regionalized the gene to Xp11.4–p11.2 by in situ hybridization. Beck et al. (1987) deduced the complete 606–amino acid sequence of the human ARAF1 oncogene from the 2,453–nucleotide sequence of the cDNA. Avner et al. (1987) found that in the mouse the A-raf oncogene is on the X chromosome, 10 to 17 cM proximal to the Hprt gene. The localization was considered compatible with the presence of the ARAF oncogene on the short arm

of the X chromosome between the centromere and Xp21 in man. The RAF protooncogenes encode cytoplasmic protein serine/threonine kinases that play a critical role in cell growth and development. Araf1 in the mouse is expressed predominantly in urogenital tissues. Lee et al. (1994) demonstrated that the ARAF1 gene in the human comprises 16 exons encoded by a minimum of 10,776 nucleotides.

[36894] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[36895] Beck, T. W.; Huleihel, M.; Gunnell, M.; Bonner, T. I.; Rapp, U. R. : The complete coding sequence of the human A-raf-1 oncogene and transforming activity of a human A-raf carrying retrovirus. Nucleic Acids Res. 15: 595-609, 1987. ; and

[36896] Lee, J.-E.; Beck, T. W.; Brennscheidt, U.; DeGennaro, L. J.; Rapp, U. R. : The complete sequence and promoter activity of the human A-raf-1 gene (ARAF1). Genomics 20: 43-55, 1994.

[36897] Further studies establishing the function and utilities of ARAF1 are found in John Hopkins OMIM database record ID 311010, and in cited publications numbered

8382–8387 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CARPX (Accession NM_020178) is another VGAM996 host target gene. CARPX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARPX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARPX BINDING SITE, designated SEQ ID:21393, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36898] Another function of VGAM996 is therefore inhibition of CARPX (Accession NM_020178), a gene which is alpha-carbonic anhydrases-related protein. Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARPX. The function of CARPX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM904.RP42 (Accession NM_020640) is another VGAM996 host target gene. RP42 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by RP42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP42 BINDING SITE, designated SEQ ID:21799, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36899] Another function of VGAM996 is therefore inhibition of RP42 (Accession NM_020640), a gene which not clear yet. Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP42. The function of RP42 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM47. Sarcospan (Kras oncogene-associated gene) (SSPN, Accession NM_005086) is another VGAM996 host target gene. SSPN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSPN BINDING SITE, designated SEQ ID:11535, to the nucleotide se-

quence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36900] Another function of VGAM996 is therefore inhibition of Sarcospan (Kras oncogene-associated gene) (SSPN, Accession NM_005086), a gene which spans the muscle plasma membrane and forms a link between the f-actin cytoskeleton and the extracellular matrix. Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSPN. The function of SSPN has been established by previous studies. Scott et al. (1994) reported the sequence of a gene in mice that is coamplified with Ki-ras (OMIM Ref. No. 190070) in the Y1 murine adrenal carcinoma cell line. The gene, designated Krag (Kirsten ras-associated gene) by them, consists of 3 exons and spans about 20 kb of genomic DNA. The Krag gene has a CG-rich promoter and first exon. The predicted 216-amino acid polypeptide encodes a protein with 4 potential hydrophobic domains, and its hydropathy plot resembles certain of the transmembrane-4 superfamily members such as CO-029 (OMIM Ref. No. 600769) and ME491 (OMIM Ref. No. 155740). An apparently homologous EST was mapped to chromosome 12. Heighway et al. (1996) isolated the hu-

man KRAG gene and showed that the predicted amino acid sequence is 91% identical to the mouse sequence. The human gene also contains 3 exons. Northern blots showed that KRAG is expressed in a variety of tissues with highest levels in muscle, where alternative splice variants were also observed. A YAC clone containing KRAG was mapped by fluorescence in situ hybridization to 12p11.2. One end of the YAC contained a sequence that was identical to that reported for inositol 1,4,5-triphosphate receptor type 2 (ITPR2; 600144), which had previously been mapped to 12p11. Heighway et al. (1996) showed that in certain tumors KRAS2, KRAG, and ITPR2 were all coamplified.

[36901] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[36902] Heighway, J.; Betticher, D. C.; Hoban, P. R.; Altermatt, H. J.; Cowen, R. : Coamplification in tumors of KRAS2, type 2 inositol 1,4,5 triphosphate receptor gene, and a novel human gene, KRAG. Genomics 35: 207-214, 1996. ; and

[36903] Scott, A. F.; Elizaga, A.; Morrell, J.; Bergen, A.; Penno, M. B. : Characterization of a gene coamplified with Ki-ras in Y1 murine adrenal carcinoma cells that codes for a putative

memb.

[36904] Further studies establishing the function and utilities of SSPN are found in John Hopkins OMIM database record ID 601599, and in cited publications numbered 642 and 9335–9336 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Wingless-type MMTV Integration Site Family, Member 5A (WNT5A, Accession NM_003392) is another VGAM996 host target gene. WNT5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WNT5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT5A BINDING SITE, designated SEQ ID:9428, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36905] Another function of VGAM996 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 5A (WNT5A, Accession NM_003392), a gene which is a ligand for members of the frizzled family of seven transmembrane receptors and is probably a developmental protein. Accordingly, utilities of VGAM996 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with WNT5A. The function of WNT5A has been established by previous studies. The Wnt genes belong to a family of protooncogenes with at least 13 known members that are expressed in species ranging from *Drosophila* to man. The name Wnt denotes the relationship of this family to the *Drosophila* segment polarity gene 'wingless' and to its vertebrate ortholog, *Int1*, a mouse protooncogene (see OMIM Ref. No. 164820). Transcription of Wnt family genes appears to be developmentally regulated in a precise temporal and spatial manner. The Wnt family is considered to be 1 of the 3 major families of signaling molecules in the mouse, the others being the fibroblast growth factor-related family (see OMIM Ref. No. 164980) and the transforming growth factor-beta-related family (TGFB; 190180). Using degenerate PCR and cDNA library screening to search for mouse genes related to Wnt1, Gavin et al. (1990) identified 6 new members of the Wnt gene family, including Wnt5a. The Wnt genes encode 38- to 43-kD cysteine-rich putative glycoproteins, which have features typical of secreted growth factors: a hydrophobic signal sequence and 21 conserved cysteine residues whose relative spacing is maintained.

Northern blot analysis detected expression of Wnt5a in brain, lung, and heart. At least 5 distinct Wnt5a transcripts were observed, which Gavin et al. (1990) hypothesized were due to transcript variability 5-prime to the initiation methionine. In situ hybridization detected a complex spatial and temporal pattern of Wnt5a in the mouse, including expression in the developing central nervous system, limbs, facial processes, and the posterior region of the fetus. Clark et al. (1993) cloned and sequenced several overlapping cDNAs encoding approximately 4.1 kb of the human homolog of Wnt5A. Expression of the human gene, symbolized WNT5A, was detected only in neonatal heart and lung. He et al. (1997) showed that human frizzled-5 (OMIM Ref. No. 601723) is the receptor for the Wnt5A ligand.

[36906] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[36907] Gavin, B. J.; McMahon, J. A.; McMahon, A. P. : Expression of multiple novel Wnt-1/int-1-related genes during fetal and adult mouse development. Genes Dev. 4: 2319-2332, 1990. ; and

[36908] He, X.; Saint-Jeannet, J.-P.; Wang, Y.; Nathans, J.; Dawid,

I.; Varmus, H. : A member of the frizzled protein family mediating axis induction by Wnt-5A. Science 275: 1652-1654, 1997.

[36909] Further studies establishing the function and utilities of WNT5A are found in John Hopkins OMIM database record ID 164975, and in cited publications numbered 328 and 12747 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CDT6 (Accession NM_021146) is another VGAM996 host target gene. CDT6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDT6 BINDING SITE, designated SEQ ID:22118, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36910] Another function of VGAM996 is therefore inhibition of CDT6 (Accession NM_021146). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT6. FLJ23251 (Accession NM_024818) is another VGAM996 host target gene. FLJ23251 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ23251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23251 BINDING SITE, designated SEQ ID:24209, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36911] Another function of VGAM996 is therefore inhibition of FLJ23251 (Accession NM_024818). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23251. KIAA0461 (Accession XM_047883) is another VGAM996 host target gene. KIAA0461 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0461 BINDING SITE, designated SEQ ID:35073, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36912] Another function of VGAM996 is therefore inhibition of

KIAA0461 (Accession XM_047883). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0461. KIAA1819 (Accession XM_045716) is another VGAM996 host target gene. KIAA1819 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1819 BINDING SITE, designated SEQ ID:34532, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36913] Another function of VGAM996 is therefore inhibition of KIAA1819 (Accession XM_045716). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1819. MAC30 (Accession XM_031536) is another VGAM996 host target gene. MAC30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAC30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of MAC30 BINDING SITE, designated SEQ ID:31402, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36914] Another function of VGAM996 is therefore inhibition of MAC30 (Accession XM_031536). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAC30. Sema Domain, Transmembrane Domain (TM), and Cytoplasmic Domain, (semaphorin) 6A (SEMA6A, Accession NM_020796) is another VGAM996 host target gene. SEMA6A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA6A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA6A BINDING SITE, designated SEQ ID:21879, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36915] Another function of VGAM996 is therefore inhibition of Sema Domain, Transmembrane Domain (TM), and Cytoplasmic Domain, (semaphorin) 6A (SEMA6A, Accession

NM_020796). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA6A. Tumor Protein D52 (TPD52, Accession NM_005079) is another VGAM996 host target gene. TPD52 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPD52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPD52 BINDING SITE, designated SEQ ID:11530, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36916] Another function of VGAM996 is therefore inhibition of Tumor Protein D52 (TPD52, Accession NM_005079). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPD52. LOC124460 (Accession XM_071892) is another VGAM996 host target gene. LOC124460 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC124460 BINDING SITE, designated SEQ ID:37441, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36917] Another function of VGAM996 is therefore inhibition of LOC124460 (Accession XM_071892). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124460. LOC130814 (Accession XM_059471) is another VGAM996 host target gene. LOC130814 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130814 BINDING SITE, designated SEQ ID:37007, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36918] Another function of VGAM996 is therefore inhibition of LOC130814 (Accession XM_059471). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130814. LOC131827 (Accession XM_059536) is an-

other VGAM996 host target gene. LOC131827 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131827 BINDING SITE, designated SEQ ID:37013, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36919] Another function of VGAM996 is therefore inhibition of LOC131827 (Accession XM_059536). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131827. LOC136319 (Accession XM_059839) is another VGAM996 host target gene. LOC136319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC136319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136319 BINDING SITE, designated SEQ ID:37101, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36920] Another function of VGAM996 is therefore inhibition of LOC136319 (Accession XM_059839). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136319. LOC148267 (Accession XM_086129) is another VGAM996 host target gene. LOC148267 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148267 BINDING SITE, designated SEQ ID:38516, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36921] Another function of VGAM996 is therefore inhibition of LOC148267 (Accession XM_086129). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148267. LOC221806 (Accession XM_166518) is another VGAM996 host target gene. LOC221806 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221806, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221806 BINDING SITE, designated SEQ ID:44453, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36922] Another function of VGAM996 is therefore inhibition of LOC221806 (Accession XM_166518). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221806. LOC91445 (Accession XM_018516) is another VGAM996 host target gene. LOC91445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91445 BINDING SITE, designated SEQ ID:30366, to the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, also designated SEQ ID:3707.

[36923] Another function of VGAM996 is therefore inhibition of LOC91445 (Accession XM_018516). Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91445. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 997 (VGAM997) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36924] VGAM997 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM997 was detected is described hereinabove with reference to Figs. 1–8.

[36925] VGAM997 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM997 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36926] VGAM997 gene encodes a VGAM997 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM997 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM997 precursor RNA is designated SEQ ID:983, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:983 is located at position 65867 relative to the genome of Cowpox Virus.

[36927] VGAM997 precursor RNA folds onto itself, forming VGAM997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36928] An enzyme complex designated DICER COMPLEX, `dices` the VGAM997 folded precursor RNA into VGAM997 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM997 RNA is designated SEQ ID:3708, and is provided hereinbelow with reference to the sequence listing part.

[36929] VGAM997 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM997 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM997 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36930] VGAM997 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM997 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM997 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM997 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM997 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36931] The complementary binding of VGAM997 RNA, herein designated VGAM RNA, to host target binding sites on VGAM997 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM997 host target RNA into VGAM997 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36932] It is appreciated that VGAM997 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM997 host target genes. The mRNA of each one of this plurality of VGAM997 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM997 RNA, herein designated VGAM RNA, and which when bound by VGAM997 RNA causes in-

hibition of translation of respective one or more VGAM997 host target proteins.

[36933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM997 gene, herein designated VGAM GENE, on one or more VGAM997 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36934] It is yet further appreciated that a function of VGAM997 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM997 include diagnosis, prevention and

treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM997 correlate with, and may be deduced from, the identity of the host target genes which VGAM997 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [36935] Nucleotide sequences of the VGAM997 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM997 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM997 are further described hereinbelow with reference to Table 1.
- [36936] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM997 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM997 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [36937] As mentioned hereinabove with reference to Fig. 1, a function of VGAM997 gene, herein designated VGAM is inhibition of expression of VGAM997 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM997 correlate with, and may be deduced from, the identity of the target genes which VGAM997 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36938] Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM_000838) is a VGAM997 host target gene. GRM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM1 BINDING SITE, designated SEQ ID:6494, to the nucleotide sequence of VGAM997 RNA, herein designated VGAM RNA, also designated SEQ ID:3708.

[36939] A function of VGAM997 is therefore inhibition of Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM_000838), a gene which promotes phosphoinositide hydrolysis. Accordingly, utilities of VGAM997 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM1. The function of GRM1 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM786. Solute Carrier Family 13 (sodium/sulfate symporters), Member 1 (SLC13A1, Accession NM_022444) is another VGAM997 host target gene. SLC13A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC13A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC13A1 BINDING SITE, designated SEQ ID:22774, to the nucleotide sequence of VGAM997 RNA, herein designated VGAM RNA, also designated SEQ ID:3708.

[36940] Another function of VGAM997 is therefore inhibition of Solute Carrier Family 13 (sodium/sulfate symporters), Member 1 (SLC13A1, Accession NM_022444). Accordingly, utilities of VGAM997 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC13A1. GFR (Accession NM_012294) is another VGAM997 host target gene. GFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:14636, to the nucleotide sequence of VGAM997 RNA, herein designated VGAM RNA, also designated SEQ ID:3708.

[36941] Another function of VGAM997 is therefore inhibition of GFR (Accession NM_012294). Accordingly, utilities of VGAM997 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. KIAA1878 (Accession XM_166256) is another VGAM997 host target gene. KIAA1878 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1878 BINDING SITE, designated SEQ ID:44074, to the nucleotide sequence of VGAM997 RNA, herein designated VGAM RNA, also designated SEQ ID:3708.

[36942] Another function of VGAM997 is therefore inhibition of KIAA1878 (Accession XM_166256). Accordingly, utilities of VGAM997 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1878. LOC222681 (Accession XM_167116) is another

VGAM997 host target gene. LOC222681 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222681 BINDING SITE, designated SEQ ID:44614, to the nucleotide sequence of VGAM997 RNA, herein designated VGAM RNA, also designated SEQ ID:3708.

[36943] Another function of VGAM997 is therefore inhibition of LOC222681 (Accession XM_167116). Accordingly, utilities of VGAM997 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222681. LOC257507 (Accession XM_175204) is another VGAM997 host target gene. LOC257507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257507 BINDING SITE, designated SEQ ID:46680, to the nucleotide sequence of VGAM997 RNA, herein designated VGAM RNA, also designated SEQ ID:3708.

[36944] Another function of VGAM997 is therefore inhibition of LOC257507 (Accession XM_175204). Accordingly, utilities of VGAM997 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257507. LOC257625 (Accession XM_175267) is another VGAM997 host target gene. LOC257625 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257625 BINDING SITE, designated SEQ ID:46736, to the nucleotide sequence of VGAM997 RNA, herein designated VGAM RNA, also designated SEQ ID:3708.

[36945] Another function of VGAM997 is therefore inhibition of LOC257625 (Accession XM_175267). Accordingly, utilities of VGAM997 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257625. LOC93297 (Accession XM_050370) is another VGAM997 host target gene. LOC93297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93297, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93297 BINDING SITE, designated SEQ ID:35615, to the nucleotide sequence of VGAM997 RNA, herein designated VGAM RNA, also designated SEQ ID:3708.

[36946] Another function of VGAM997 is therefore inhibition of LOC93297 (Accession XM_050370). Accordingly, utilities of VGAM997 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93297. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 998 (VGAM998) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36947] VGAM998 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM998 was detected is described hereinabove with reference to Figs. 1–8.

[36948] VGAM998 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM998 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[36949] VGAM998 gene encodes a VGAM998 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM998 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM998 precursor RNA is designated SEQ ID:984, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:984 is located at position 64470 relative to the genome of Cowpox Virus.

[36950] VGAM998 precursor RNA folds onto itself, forming VGAM998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36951] An enzyme complex designated DICER COMPLEX, `dices` the VGAM998 folded precursor RNA into VGAM998 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM998 RNA is designated SEQ ID:3709, and is provided hereinbelow with reference to the sequence listing part.

[36952] VGAM998 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM998 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM998 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36953] VGAM998 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM998 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM998 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM998 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM998 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36954] The complementary binding of VGAM998 RNA, herein designated VGAM RNA, to host target binding sites on VGAM998 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM998 host target RNA into VGAM998 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[36955] It is appreciated that VGAM998 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM998 host target genes. The mRNA of each one of this plurality of VGAM998 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM998 RNA, herein designated VGAM RNA, and which when bound by VGAM998 RNA causes inhibition of translation of respective one or more VGAM998 host target proteins.

[36956] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM998 gene, herein designated VGAM GENE, on one or more VGAM998 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36957] It is yet further appreciated that a function of VGAM998 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM998 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM998 correlate with, and may be deduced from, the identity of the host target genes which VGAM998 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36958] Nucleotide sequences of the VGAM998 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM998 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM998 are further described hereinbelow with reference to Table 1.

[36959] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM998 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM998 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36960] As mentioned hereinabove with reference to Fig. 1, a function of VGAM998 gene, herein designated VGAM is inhibition of expression of VGAM998 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM998 correlate with, and may be deduced from, the identity of the target genes which VGAM998 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36961] Cleavage and Polyadenylation Specific Factor 4, 30kDa (CPSF4, Accession NM_006693) is a VGAM998 host target gene. CPSF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPSF4 BINDING SITE, designated SEQ ID:13511, to the nucleotide sequence of VGAM998 RNA,

herein designated VGAM RNA, also designated SEQ ID:3709.

[36962] A function of VGAM998 is therefore inhibition of Cleavage and Polyadenylation Specific Factor 4, 30kDa (CPSF4, Accession NM_006693), a gene which may bind DNA. Accordingly, utilities of VGAM998 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF4. The function of CPSF4 has been established by previous studies. Nemeroff et al. (1998) used the yeast 2-hybrid interaction trap to screen a human HeLa cDNA library for proteins that interact with the effector domain of the influenza A virus NS1 protein. They identified 1 such protein, termed NEB1 (NS1 effector domain-binding protein-1), which was almost identical to the bovine cleavage-polyadenylation specificity factor (CPSF) 30-kD subunit (Barabino et al., 1997). The human CPSF30 protein contains 236 amino acids. CPSF30 is an essential component of the 3-prime end processing machinery of cellular pre-mRNAs. In influenza virus-infected cells, the NS1 protein is physically associated with CPSF30. Binding of the NS1 protein to the CPSF30 protein in vitro prevents CPSF binding to the RNA substrate and inhibits 3-prime end cleavage and polyadenylation of host

pre-mRNAs. The NS1 protein also inhibits 3-prime end processing in vivo, and the uncleaved pre-mRNA remains in the nucleus. Via this regulation of pre-mRNA 3-prime end processing, the NS1 protein selectively inhibits the nuclear export of cellular, and not viral, mRNAs.

[36963] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[36964] Nemeroff, M. E.; Barabino, S. M. L.; Li, Y.; Keller, W.; Krug, R. M. : Influenza virus NS1 protein interacts with the cellular 30 kDa subunit of CPSF and inhibits 3-prime end formation of cellular pre-mRNAs. *Molec. Cell* 1: 991-1000, 1998. ; and

[36965] Barabino, S. M. L.; Hubner, W.; Jenny, A.; Minvielle-Sebastia, L.; Keller, W. : The 30 kDa subunit of mammalian cleavage and polyadenylation specificity factor and its yeast homolog are.

[36966] Further studies establishing the function and utilities of CPSF4 are found in John Hopkins OMIM database record ID 603052, and in cited publications numbered 8015-8016 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Von Hippel-Lindau Syndrome (VHL, Accession NM_000551) is another

VGAM998 host target gene. VHL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:6163, to the nucleotide sequence of VGAM998 RNA, herein designated VGAM RNA, also designated SEQ ID:3709.

[36967] Another function of VGAM998 is therefore inhibition of Von Hippel-Lindau Syndrome (VHL, Accession NM_000551), a gene which may control rna stability through the selective degradation of rna-bound proteins. Accordingly, utilities of VGAM998 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VHL. The function of VHL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM197.IMPACT (Accession NM_018439) is another VGAM998 host target gene. IMPACT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMPACT, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPACT BINDING SITE, designated SEQ ID:20505, to the nucleotide sequence of VGAM998 RNA, herein designated VGAM RNA, also designated SEQ ID:3709.

[36968] Another function of VGAM998 is therefore inhibition of IMPACT (Accession NM_018439). Accordingly, utilities of VGAM998 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPACT. MGC20496 (Accession NM_052845) is another VGAM998 host target gene. MGC20496 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20496 BINDING SITE, designated SEQ ID:27425, to the nucleotide sequence of VGAM998 RNA, herein designated VGAM RNA, also designated SEQ ID:3709.

[36969] Another function of VGAM998 is therefore inhibition of MGC20496 (Accession NM_052845). Accordingly, utilities of VGAM998 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC20496. Triple Homeobox 1 (TIX1, Accession XM_029734) is another VGAM998 host target gene. TIX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIX1 BINDING SITE, designated SEQ ID:30930, to the nucleotide sequence of VGAM998 RNA, herein designated VGAM RNA, also designated SEQ ID:3709.

[36970] Another function of VGAM998 is therefore inhibition of Triple Homeobox 1 (TIX1, Accession XM_029734). Accordingly, utilities of VGAM998 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIX1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 999 (VGAM999) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36971] VGAM999 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM999 was detected is described hereinabove with reference to Figs. 1–8.

[36972] VGAM999 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM999 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36973] VGAM999 gene encodes a VGAM999 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM999 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM999 precursor RNA is designated SEQ ID:985, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:985 is located at position 62693 relative to the genome of Cowpox Virus.

[36974] VGAM999 precursor RNA folds onto itself, forming VGAM999 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36975] An enzyme complex designated DICER COMPLEX, `dices` the VGAM999 folded precursor RNA into VGAM999 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM999 RNA is designated SEQ ID:3710, and is provided hereinbelow with reference to the sequence listing part.

[36976] VGAM999 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM999 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM999 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36977] VGAM999 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM999 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM999 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM999 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM999 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[36978] The complementary binding of VGAM999 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM999 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM999 host target RNA into VGAM999 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36979] It is appreciated that VGAM999 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM999 host target genes. The mRNA of each one of this plurality of VGAM999 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM999 RNA, herein designated VGAM RNA, and which when bound by VGAM999 RNA causes inhibition of translation of respective one or more VGAM999 host target proteins.

[36980] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM999 gene, herein designated VGAM GENE, on one or more VGAM999 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36981] It is yet further appreciated that a function of VGAM999 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM999 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM999 correlate with, and may be deduced from, the identity of the host target genes which VGAM999 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36982] Nucleotide sequences of the VGAM999 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM999 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM999 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM999 are further described hereinbelow with reference to Table 1.

[36983] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM999 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM999 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36984] As mentioned hereinabove with reference to Fig. 1, a function of VGAM999 gene, herein designated VGAM is inhibition of expression of VGAM999 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM999 correlate with, and may be deduced from, the identity of the target genes which VGAM999 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36985] Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is a VGAM999 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14877, to the nucleotide sequence of VGAM999 RNA, herein designated VGAM RNA, also designated SEQ ID:3710.

[36986] A function of VGAM999 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM999 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.KIAA1468 (Accession XM_166289) is another VGAM999 host target gene. KIAA1468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of KIAA1468 BINDING SITE, designated SEQ ID:44097, to the nucleotide sequence of VGAM999 RNA, herein designated VGAM RNA, also designated SEQ ID:3710.

[36987] Another function of VGAM999 is therefore inhibition of KIAA1468 (Accession XM_166289). Accordingly, utilities of VGAM999 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1468. KIAA1979 (Accession XM_113984) is another VGAM999 host target gene. KIAA1979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1979 BINDING SITE, designated SEQ ID:42588, to the nucleotide sequence of VGAM999 RNA, herein designated VGAM RNA, also designated SEQ ID:3710.

[36988] Another function of VGAM999 is therefore inhibition of KIAA1979 (Accession XM_113984). Accordingly, utilities of VGAM999 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1979. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1000 (VGAM1000) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36989] VGAM1000 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1000 was detected is described hereinabove with reference to Figs. 1–8.

[36990] VGAM1000 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM1000 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36991] VGAM1000 gene encodes a VGAM1000 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1000 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1000 precursor RNA is designated SEQ ID:986, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:986 is located at position 63271 relative to the genome of Cowpox Virus.

[36992] VGAM1000 precursor RNA folds onto itself, forming VGAM1000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36993] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1000 folded precursor RNA into VGAM1000 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1000 RNA is designated SEQ ID:3711, and is provided hereinbelow with reference to the sequence listing part.

[36994] VGAM1000 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1000 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1000 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[36995] VGAM1000 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1000 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1000 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1000 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1000 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[36996] The complementary binding of VGAM1000 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1000 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1000 host target RNA into VGAM1000 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36997] It is appreciated that VGAM1000 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1000 host target genes. The mRNA of each one of this plurality of VGAM1000 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1000 RNA, herein designated VGAM RNA, and which when bound by VGAM1000 RNA causes inhibition of translation of respective one or more

VGAM1000 host target proteins.

[36998] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1000 gene, herein designated VGAM GENE, on one or more VGAM1000 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[36999] It is yet further appreciated that a function of VGAM1000 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific

functions, and accordingly utilities, of VGAM1000 correlate with, and may be deduced from, the identity of the host target genes which VGAM1000 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37000] Nucleotide sequences of the VGAM1000 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1000 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1000 are further described hereinbelow with reference to Table 1.

[37001] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1000 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1000 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37002] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1000 gene, herein designated VGAM is inhibition of expression of VGAM1000 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1000 correlate with, and may be deduced from, the identity of the target genes which VGAM1000 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37003] EphB1 (EPHB1, Accession NM_004441) is a VGAM1000 host target gene. EPHB1 BINDING SITE1 and EPHB1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EPHB1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB1 BINDING SITE1 and EPHB1 BINDING SITE2, designated SEQ ID:10727 and SEQ ID:10726 respectively, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37004] A function of VGAM1000 is therefore inhibition of EphB1 (EPHB1, Accession NM_004441), a gene which receptor for members of the ephrin-b family. binds to ephrin-b1, -b2 and -b3. Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB1. The function of EPHB1 has been established by previous studies. See 179610 for background on Eph receptors and their ligands, the

ephrins. Tang et al. (1995) cloned and characterized a member of the EPH-related receptor protein tyrosine kinases and designated it NET (neuronally expressed EPH-related tyrosine kinase). The cDNA was isolated from a fetal brain expression library using a monoclonal antibody. The 3.9-kb RNA encodes a predicted protein of 984 amino acids with 2 hydrophobic regions corresponding to possible signal peptide and transmembrane domains. The NET protein shares 99% amino acid identity with Elk, the rat homolog. Northern blots showed maximal NET expression in the nervous system and in some tumor cell lines derived from neuroectoderm. Using immunohistochemical analysis of the developing mouse hindbrain, Cowan et al. (2000) detected Ephb1 expression in the floor plate and in hindbrain regions where facial and inner ear efferent neurons are located. Contractor et al. (2002) reported that mossy fiber long-term potentiation was reduced by perfusion of postsynaptic neurons with peptides and antibodies that interfere with binding of EphB receptor tyrosine kinases to the PDZ protein GRIP (GRIP1; 604597). Mossy fiber long-term potentiation was also reduced by extracellular application of soluble forms of beta-ephrins, which are normally membrane-anchored

presynaptic ligands for the EphB receptors. The application of soluble ligands for presynaptic ephrins increased basal excitatory transmission and occluded both tetanus and forskolin-induced synaptic potentiation. Contractor et al. (2002) concluded that the PDZ interactions in postsynaptic neuron and transsynaptic interactions between postsynaptic EphB receptors and presynaptic beta-ephrins are necessary for the induction of mossy fiber long-term potentiation. Tang et al. (1995) mapped the EPHB1 gene to 3q21-q23 by fluorescence in situ hybridization.

[37005] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37008] Further studies establishing the function and utilities of EPHB1 are found in John Hopkins OMIM database record ID 600600, and in cited publications numbered 1038 and 12328 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377) is another VGAM1000 host target gene. MYCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCL2 BINDING SITE, designated SEQ ID:11854, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37009] Another function of VGAM1000 is therefore inhibition of V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377). Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCL2. Prokineticin 1 (PROK1, Accession NM_032414) is another VGAM1000 host target gene.

PROK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PROK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROK1 BINDING SITE, designated SEQ ID:26195, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37010] Another function of VGAM1000 is therefore inhibition of Prokineticin 1 (PROK1, Accession NM_032414), a gene which induces proliferation, migration and fenestration in capillary endothelial cells derived from endocrine glands. Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROK1. The function of PROK1 has been established by previous studies. Endocrine gland-derived vascular endothelial growth factor (EG-VEGF) induces proliferation, migration, and fenestration in capillary endothelial cells derived from endocrine glands. Its expression is induced by hypoxia and is restricted to the steroidogenic glands (ovary, testis, adrenal, and placenta). Its expression is often complementary to the expression

of VEGF (OMIM Ref. No. 192240), suggesting that these molecules function in a coordinated manner. LeCouter et al. (2001) screened a library of purified human secreted proteins for the ability to induce proliferation in primary bovine adrenal cortex–derived capillary endothelial cells. EG–VEGF was capable of inducing a strong and reproducible mitogenic response. Mature EG–VEGF is a protein with a relative molecular mass of 8,600 encoded by a cDNA cloned from human ovary library. The 1.4–kb cDNA encodes a protein of 105 amino acids with a well defined signal sequence. The mature protein is predicted to have 86 amino acids, including 10 cysteines, and an expected isoelectric point of 8.46. These cysteines potentially form 5 disulfide bridges. EG–VEGF displays a high degree of homology to a nontoxic protein purified from the venom of the black mamba snake, venom protein A (VPRA). The structure of native VPRA was solved, and the disulfide bridge partners were revealed. The number and spacing of cysteines are completely conserved between VPRA and EG–VEGF. BV8, a human molecule closely related to a peptide isolated from the yellow–bellied toad, is 58% identical to the EG–VEGF mature protein. There is also significant homology to the carboxy–terminal sequence of *Xenopus*

dickkopf (see OMIM Ref. No. 605189) and to colipase (OMIM Ref. No. 120105). Li et al. (2001) identified EG-VEGF as prokineticin-1. EG-VEGF is mitogenic and chemoattractive and able to induce fenestration. EG-VEGF expression is induced by hypoxia, and there is an HIF1 (OMIM Ref. No. 603348) binding site present on EG-VEGF. EG-VEGF is able to induce angiogenesis and ovarian cyst formation. Northern blot analysis demonstrated expression in testis, ovary, adrenal gland, and placenta. A signal was detectable in prostate after prolonged exposure

[37011] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37012] LeCouter, J.; Kowalski, J.; Foster, J.; Hass, P.; Zhang, Z.; Dillard-Telm, L.; Frantz, G.; Rangell, L.; DeGuzman, L.; Keller, G.-A.; Peale, F.; Gurney, P.; Hillan, K. J.; Ferrara, N. : Identification of an angiogenic mitogen selective for endocrine gland endothelium. Nature 412: 877-884, 2001. ; and

[37013] Li, M.; Bullock, C. M.; Knauer, D. J.; Ehlert, F. J.; Zhou, Q. Y. : Identification of two prokineticin cDNAs: recombinant proteins potently contract gastrointestinal smooth muscle. Mol.

[37014] Further studies establishing the function and utilities of PROK1 are found in John Hopkins OMIM database record ID 606233, and in cited publications numbered 6644–6645 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Titin Immunoglobulin Domain Protein (myotilin) (TTID, Accession NM_006790) is another VGAM1000 host target gene. TTID BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TTID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTID BINDING SITE, designated SEQ ID:13668, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37015] Another function of VGAM1000 is therefore inhibition of Titin Immunoglobulin Domain Protein (myotilin) (TTID, Accession NM_006790), a gene which is a sarcomeric structural protein. Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTID. The function of TTID has been established by previous studies. By radiation hybrid mapping, Salmikangas et al. (1999) located the

myotilin gene on 5q31 between markers AFM350yB1 and D5S500. The locus of a dominantly inherited limb-girdle muscular dystrophy, LGMD1A (OMIM Ref. No. 159000), resides in an overlapping narrow segment, and a form of distal myopathy with vocal cord and pharyngeal weakness (OMIM Ref. No. 158580) maps to the same region. Muscle specificity and apparent role as a sarcomeric structural protein raise the possibility that defects in the myotilin gene may cause muscular dystrophy. Hauser et al. (2000) identified a mutation in the myotilin gene (thr57 to ile; 604103.0001) in a large North American family of German descent segregating LGMD1A. The mutant allele was transcribed, and normal levels of correctly localized myotilin protein were seen in LGMD1A muscle. The mutation did not disrupt binding to alpha-actinin.

[37016] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37017] Salmikangas, P.; Mykkanen, O.-M.; Gronholm, M.; Heiska, L.; Kere, J.; Carpen, O. : Myotilin, a novel sarcomeric protein with two Ig-like domains, is encoded by a candidate gene for limb-girdle muscular dystrophy. Hum. Molec. Genet. 8: 1329-1336, 1999. ; and

[37018] Hauser, M. A.; Horrigan, S. K.; Salmikangas, P.; Torian, U. M.; Viles, K. D.; Dancel, R.; Tim, R. W.; Taivainen, A.; Bartoloni, L.; Gilchrist, J. M.; Stajich, J. M.; Gaskell, P. C.; Gilber.

[37019] Further studies establishing the function and utilities of TTID are found in John Hopkins OMIM database record ID 604103, and in cited publications numbered 5084 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM_032294) is another VGAM1000 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26062, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37020] Another function of VGAM1000 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM_032294). Accordingly,

utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. DKFZp547I094 (Accession NM_032155) is another VGAM1000 host target gene. DKFZp547I094 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp547I094, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I094 BINDING SITE, designated SEQ ID:25854, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37021] Another function of VGAM1000 is therefore inhibition of DKFZp547I094 (Accession NM_032155). Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I094. DKFZp761O17121 (Accession NM_032287) is another VGAM1000 host target gene. DKFZp761O17121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761O17121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761O17121 BINDING SITE, designated SEQ ID:26043, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37022] Another function of VGAM1000 is therefore inhibition of DKFZp761O17121 (Accession NM_032287). Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O17121. FLJ21438 (Accession XM_029084) is another VGAM1000 host target gene. FLJ21438 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21438 BINDING SITE, designated SEQ ID:30842, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37023] Another function of VGAM1000 is therefore inhibition of FLJ21438 (Accession XM_029084). Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ21438. Mab-21-like 2 (*C. elegans*) (MAB21L2, Accession NM_006439) is another VGAM1000 host target gene. MAB21L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAB21L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAB21L2 BINDING SITE, designated SEQ ID:13147, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37024] Another function of VGAM1000 is therefore inhibition of Mab-21-like 2 (*C. elegans*) (MAB21L2, Accession NM_006439). Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAB21L2. MDN1, Midasin Homolog (yeast) (MDN1, Accession XM_031539) is another VGAM1000 host target gene. MDN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDN1 BIND-

ING SITE, designated SEQ ID:31408, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37025] Another function of VGAM1000 is therefore inhibition of MDN1, Midasin Homolog (yeast) (MDN1, Accession XM_031539). Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDN1. LOC220766 (Accession XM_165471) is another VGAM1000 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43645, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37026] Another function of VGAM1000 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC255565 (Accession XM_170811) is an-

other VGAM1000 host target gene. LOC255565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255565 BINDING SITE, designated SEQ ID:45586, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37027] Another function of VGAM1000 is therefore inhibition of LOC255565 (Accession XM_170811). Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255565. LOC92230 (Accession XM_043733) is another VGAM1000 host target gene. LOC92230 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92230, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92230 BINDING SITE, designated SEQ ID:34005, to the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, also designated SEQ ID:3711.

[37028] Another function of VGAM1000 is therefore inhibition of LOC92230 (Accession XM_043733). Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92230. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1001 (VGAM1001) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37029] VGAM1001 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1001 was detected is described hereinabove with reference to Figs. 1–8.

[37030] VGAM1001 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM1001 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37031] VGAM1001 gene encodes a VGAM1001 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1001 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1001 precursor RNA is designated SEQ ID:987, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:987 is located at position 62554 relative to the genome of Cowpox Virus.

[37032] VGAM1001 precursor RNA folds onto itself, forming VGAM1001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37033] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1001 folded precursor RNA into VGAM1001 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1001 RNA is designated SEQ ID:3712, and is provided hereinbelow with reference to the sequence listing part.

[37034] VGAM1001 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1001 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1001 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[37035] VGAM1001 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1001 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1001 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1001 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1001 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37036] The complementary binding of VGAM1001 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1001 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1001 host target RNA into VGAM1001 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37037] It is appreciated that VGAM1001 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1001 host target genes. The mRNA of each one of this plurality of VGAM1001 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1001 RNA, herein designated VGAM RNA, and which when bound by VGAM1001 RNA causes inhibition of translation of respective one or more VGAM1001 host target proteins.

[37038] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1001 gene, herein designated VGAM GENE, on one or more VGAM1001 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37039] It is yet further appreciated that a function of VGAM1001 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1001 correlate with, and may be deduced from, the identity of the host target genes which VGAM1001 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37040] Nucleotide sequences of the VGAM1001 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1001 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1001 are further described hereinbelow with reference to Table 1.

[37041] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1001 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1001 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[37042] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1001 gene, herein designated VGAM is inhibition of expression of VGAM1001 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1001 correlate with, and may be deduced from, the identity of the target genes which VGAM1001 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37043] Leucine Zipper-EF-hand Containing Transmembrane Protein 1 (LETM1, Accession NM_012318) is a VGAM1001 host target gene. LETM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LETM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LETM1 BINDING SITE, designated SEQ ID:14696, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37044] A function of VGAM1001 is therefore inhibition of Leucine Zipper-EF-hand Containing Transmembrane Protein 1 (LETM1, Accession NM_012318). Accordingly, utilities of

VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LETM1. Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_030667) is another VGAM1001 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1 through PTPRO BINDING SITE5, designated SEQ ID:25002, SEQ ID:25008, SEQ ID:25017, SEQ ID:25026 and SEQ ID:8737 respectively, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37045] Another function of VGAM1001 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_030667), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM140.Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM1001 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15355, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37046] Another function of VGAM1001 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.ATP-binding Cassette, Sub-family C

(CFTR/MRP), Member 13 (ABCC13, Accession NM_138726) is another VGAM1001 host target gene. ABCC13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCC13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC13 BINDING SITE, designated SEQ ID:28973, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37047] Another function of VGAM1001 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC13. Chromosome 22 Open Reading Frame 20 (C22orf20, Accession NM_025225) is another VGAM1001 host target gene. C22orf20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C22orf20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf20 BINDING SITE,

designated SEQ ID:24901, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37048] Another function of VGAM1001 is therefore inhibition of Chromosome 22 Open Reading Frame 20 (C22orf20, Accession NM_025225). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf20.

FLJ12056 (Accession NM_024933) is another VGAM1001 host target gene. FLJ12056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12056 BINDING SITE, designated SEQ ID:24469, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37049] Another function of VGAM1001 is therefore inhibition of FLJ12056 (Accession NM_024933). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12056. FLJ20232 (Accession NM_019008) is another

VGAM1001 host target gene. FLJ20232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20232 BINDING SITE, designated SEQ ID:21085, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37050] Another function of VGAM1001 is therefore inhibition of FLJ20232 (Accession NM_019008). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20232. FLJ30681 (Accession XM_166291) is another VGAM1001 host target gene. FLJ30681 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30681 BINDING SITE, designated SEQ ID:44105, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37051] Another function of VGAM1001 is therefore inhibition of FLJ30681 (Accession XM_166291). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30681. HSA249128 (Accession NM_017583) is another VGAM1001 host target gene. HSA249128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA249128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA249128 BINDING SITE, designated SEQ ID:19028, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37052] Another function of VGAM1001 is therefore inhibition of HSA249128 (Accession NM_017583). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA249128. KIAA0774 (Accession XM_166270) is another VGAM1001 host target gene. KIAA0774 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0774, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0774 BINDING SITE, designated SEQ ID:44087, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37053] Another function of VGAM1001 is therefore inhibition of KIAA0774 (Accession XM_166270). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0774. KIAA1164 (Accession XM_045358) is another VGAM1001 host target gene. KIAA1164 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1164 BINDING SITE, designated SEQ ID:34441, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37054] Another function of VGAM1001 is therefore inhibition of KIAA1164 (Accession XM_045358). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1164. KIAA1867 (Accession XM_170675) is another VGAM1001 host target gene. KIAA1867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1867 BINDING SITE, designated SEQ ID:45456, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37055] Another function of VGAM1001 is therefore inhibition of KIAA1867 (Accession XM_170675). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1867. LAP1B (Accession XM_035429) is another VGAM1001 host target gene. LAP1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAP1B BINDING SITE, designated SEQ ID:32264, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3712.

[37056] Another function of VGAM1001 is therefore inhibition of LAP1B (Accession XM_035429). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAP1B. MGC4796 (Accession XM_029031) is another VGAM1001 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30827, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37057] Another function of VGAM1001 is therefore inhibition of MGC4796 (Accession XM_029031). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4796. LOC134285 (Accession XM_072365) is another VGAM1001 host target gene. LOC134285 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC134285, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134285 BINDING SITE, designated SEQ ID:37490, to the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, also designated SEQ ID:3712.

[37058] Another function of VGAM1001 is therefore inhibition of LOC134285 (Accession XM_072365). Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134285. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1002 (VGAM1002) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37059] VGAM1002 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1002 was detected is described hereinabove with reference to Figs. 1-8.

[37060] VGAM1002 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cy-

tomegalovirus. VGAM1002 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37061] VGAM1002 gene encodes a VGAM1002 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1002 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1002 precursor RNA is designated SEQ ID:988, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:988 is located at position 198161 relative to the genome of Chimpanzee Cytomegalovirus.

[37062] VGAM1002 precursor RNA folds onto itself, forming VGAM1002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37063] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1002 folded precursor RNA into VGAM1002 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1002 RNA is designated SEQ ID:3713, and is provided hereinbelow with reference to the sequence listing part.

[37064] VGAM1002 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1002 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1002 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37065] VGAM1002 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1002 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1002 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1002 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1002 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37066] The complementary binding of VGAM1002 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1002 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1002 host target RNA into VGAM1002 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37067] It is appreciated that VGAM1002 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1002 host target genes. The mRNA of each one of this plurality of VGAM1002 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1002 RNA, herein designated VGAM RNA, and which when bound by VGAM1002 RNA causes inhibition of translation of respective one or more VGAM1002 host target proteins.

[37068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1002 gene, herein designated VGAM GENE, on one or more VGAM1002 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37069] It is yet further appreciated that a function of VGAM1002 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1002 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1002 correlate with, and may be deduced from, the identity of the host target genes which VGAM1002 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37070] Nucleotide sequences of the VGAM1002 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1002 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1002 are further described hereinbelow with reference to Table 1.

[37071] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1002 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1002 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37072] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1002 gene, herein designated VGAM is inhibition of expression of VGAM1002 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1002 correlate with, and may be deduced from, the identity of the target genes which VGAM1002 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37073] EGF-like-domain, Multiple 4 (EGFL4, Accession XM_029883) is a VGAM1002 host target gene. EGFL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:30967, to the

nucleotide sequence of VGAM1002 RNA, herein designated VGAM RNA, also designated SEQ ID:3713.

[37074] A function of VGAM1002 is therefore inhibition of EGF-like-domain, Multiple 4 (EGFL4, Accession XM_029883). Accordingly, utilities of VGAM1002 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL4. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1003 (VGAM1003) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37075] VGAM1003 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1003 was detected is described hereinabove with reference to Figs. 1-8.

[37076] VGAM1003 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1003 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37077] VGAM1003 gene encodes a VGAM1003 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1003 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1003 precursor RNA is designated SEQ ID:989, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:989 is located at position 199498 relative to the genome of Chimpanzee Cytomegalovirus.

[37078] VGAM1003 precursor RNA folds onto itself, forming VGAM1003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37079] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1003 folded precursor RNA into VGAM1003 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1003 RNA is designated SEQ ID:3714, and is provided hereinbelow with reference to the sequence listing part.

[37080] VGAM1003 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1003 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1003 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37081] VGAM1003 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1003 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1003 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1003 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1003 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37082] The complementary binding of VGAM1003 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1003 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1003 host target RNA into VGAM1003 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37083] It is appreciated that VGAM1003 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1003 host target genes. The mRNA of each one of this plurality of VGAM1003 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1003 RNA, herein designated VGAM RNA, and which when bound by VGAM1003 RNA causes inhibition of translation of respective one or more VGAM1003 host target proteins.

[37084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1003 gene, herein designated VGAM GENE, on one or more VGAM1003 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[37085] It is yet further appreciated that a function of VGAM1003 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cy-tomegalovirus. Specific functions, and accordingly utilities, of VGAM1003 correlate with, and may be deduced from, the identity of the host target genes which VGAM1003 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37086] Nucleotide sequences of the VGAM1003 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1003 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1003 are further described hereinbelow with reference to Table 1.

[37087] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1003 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1003 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37088] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1003 gene, herein designated VGAM is inhibition of expression of VGAM1003 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1003 correlate with, and may be deduced from, the identity of the target genes which VGAM1003 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37089] DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 3 (DDX3, Accession NM_001356) is a VGAM1003 host target gene. DDX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX3 BINDING SITE, designated SEQ ID:7033, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37090] A function of VGAM1003 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 3 (DDX3, Ac-

cession NM_001356), a gene which interacts with hepatitis c virus core protein resulting a change in intracellular location. Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX3. The function of DDX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM232.Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM_000838) is another VGAM1003 host target gene. GRM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM1 BINDING SITE, designated SEQ ID:6495, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37091] Another function of VGAM1003 is therefore inhibition of Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM_000838), a gene which promotes phosphoinositide hydrolysis. Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with GRM1. The function of GRM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM786. Transient Receptor Potential Cation Channel, Subfamily V, Member 3 (TRPV3, Accession XM_170821) is another VGAM1003 host target gene. TRPV3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV3 BINDING SITE, designated SEQ ID:45597, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37092] Another function of VGAM1003 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 3 (TRPV3, Accession XM_170821). Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV3. FLJ10936 (Accession NM_018279) is another VGAM1003 host target gene. FLJ10936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ10936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10936 BINDING SITE, designated SEQ ID:20268, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37093] Another function of VGAM1003 is therefore inhibition of FLJ10936 (Accession NM_018279). Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10936. phorbolin-1 (Accession XM_114206) is another VGAM1003 host target gene. phorbolin-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by phorbolin-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of phorbolin-1 BINDING SITE, designated SEQ ID:42798, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37094] Another function of VGAM1003 is therefore inhibition of phorbolin-1 (Accession XM_114206). Accordingly, utilities

of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical conditions associated with phorbolin-1. LOC151568 (Accession NM_138483) is another VGAM1003 host target gene. LOC151568 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151568 BINDING SITE, designated SEQ ID:28836, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37095] Another function of VGAM1003 is therefore inhibition of LOC151568 (Accession NM_138483). Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151568. LOC151996 (Accession XM_098151) is another VGAM1003 host target gene. LOC151996 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151996 BINDING SITE, designated SEQ ID:41413, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37096] Another function of VGAM1003 is therefore inhibition of LOC151996 (Accession XM_098151). Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151996. LOC196759 (Accession XM_113601) is another VGAM1003 host target gene. LOC196759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196759 BINDING SITE, designated SEQ ID:42294, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37097] Another function of VGAM1003 is therefore inhibition of LOC196759 (Accession XM_113601). Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196759. LOC201617 (Accession XM_117315) is another VGAM1003 host target gene. LOC201617 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201617 BINDING SITE, designated SEQ ID:43382, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37098] Another function of VGAM1003 is therefore inhibition of LOC201617 (Accession XM_117315). Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201617. LOC220045 (Accession XM_167820) is another VGAM1003 host target gene. LOC220045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220045 BINDING SITE, designated SEQ ID:44859, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37099] Another function of VGAM1003 is therefore inhibition of

LOC220045 (Accession XM_167820). Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220045. LOC93070 (Accession XM_049046) is another VGAM1003 host target gene. LOC93070 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93070 BINDING SITE, designated SEQ ID:35323, to the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, also designated SEQ ID:3714.

[37100] Another function of VGAM1003 is therefore inhibition of LOC93070 (Accession XM_049046). Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93070. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1004 (VGAM1004) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[37101] VGAM1004 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1004 was detected is described hereinabove with reference to Figs. 1–8.

[37102] VGAM1004 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1004 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37103] VGAM1004 gene encodes a VGAM1004 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1004 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1004 precursor RNA is designated SEQ ID:990, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:990 is located at position 199410 relative to the genome of Chimpanzee Cytomegalovirus.

[37104] VGAM1004 precursor RNA folds onto itself, forming VGAM1004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37105] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1004 folded precursor RNA into VGAM1004 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1004 RNA is designated SEQ ID:3715, and is provided hereinbelow with reference to the sequence listing part.

[37106] VGAM1004 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1004 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1004 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[37107] VGAM1004 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1004 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1004 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1004 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1004 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[37108] The complementary binding of VGAM1004 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1004 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1004 host target RNA into VGAM1004 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37109] It is appreciated that VGAM1004 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1004 host target genes. The mRNA of each one of this plurality of VGAM1004 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1004 RNA, herein designated VGAM RNA, and which when bound by VGAM1004 RNA causes inhibition of translation of respective one or more VGAM1004 host target proteins.

[37110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1004 gene, herein designated VGAM GENE, on one

or more VGAM1004 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37111] It is yet further appreciated that a function of VGAM1004 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1004 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1004 correlate with, and may be deduced from, the identity of the host target genes which VGAM1004 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37112] Nucleotide sequences of the VGAM1004 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1004 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1004 are further described hereinbelow with reference to Table 1.

[37113] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1004 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1004 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37114] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1004 gene, herein designated VGAM is inhibition of expression of VGAM1004 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1004 correlate with, and may be deduced from, the identity of the target genes which VGAM1004 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37115] FLJ20330 (Accession NM_018988) is a VGAM1004 host

target gene. FLJ20330 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20330 BINDING SITE, designated SEQ ID:21059, to the nucleotide sequence of VGAM1004 RNA, herein designated VGAM RNA, also designated SEQ ID:3715.

[37116] A function of VGAM1004 is therefore inhibition of FLJ20330 (Accession NM_018988). Accordingly, utilities of VGAM1004 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20330. PRO0529 (Accession NM_014074) is another VGAM1004 host target gene. PRO0529 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO0529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0529 BINDING SITE, designated SEQ ID:15298, to the nucleotide sequence of VGAM1004 RNA, herein designated VGAM RNA, also designated SEQ ID:3715.

[37117] Another function of VGAM1004 is therefore inhibition of PRO0529 (Accession NM_014074). Accordingly, utilities of VGAM1004 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0529. LOC93206 (Accession XM_049838) is another VGAM1004 host target gene. LOC93206 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93206 BINDING SITE, designated SEQ ID:35517, to the nucleotide sequence of VGAM1004 RNA, herein designated VGAM RNA, also designated SEQ ID:3715.

[37118] Another function of VGAM1004 is therefore inhibition of LOC93206 (Accession XM_049838). Accordingly, utilities of VGAM1004 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93206. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1005 (VGAM1005) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[37119] VGAM1005 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1005 was detected is described hereinabove with reference to Figs. 1-8.

[37120] VGAM1005 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1005 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37121] VGAM1005 gene encodes a VGAM1005 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1005 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1005 precursor RNA is designated SEQ ID:991, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:991 is located at position 196285 relative to the genome of Chimpanzee Cytomegalovirus.

[37122] VGAM1005 precursor RNA folds onto itself, forming VGAM1005 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37123] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1005 folded precursor RNA into VGAM1005 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1005 RNA is designated SEQ ID:3716, and is provided hereinbelow with reference to the sequence listing part.

[37124] VGAM1005 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1005 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1005 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37125] VGAM1005 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1005 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1005 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1005 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1005 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[37126] The complementary binding of VGAM1005 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1005 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1005 host target RNA into VGAM1005 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37127] It is appreciated that VGAM1005 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1005 host target genes. The mRNA of each one of this plurality of VGAM1005 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1005 RNA, herein designated VGAM RNA, and which when bound by VGAM1005 RNA causes inhibition of translation of respective one or more VGAM1005 host target proteins.

[37128] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1005 gene, herein designated VGAM GENE, on one or more VGAM1005 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37129] It is yet further appreciated that a function of VGAM1005 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1005 correlate with, and may be deduced from, the identity of the host target genes which VGAM1005 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[37130] Nucleotide sequences of the VGAM1005 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1005 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1005 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1005 are further described hereinbelow with reference to Table 1.

[37131] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1005 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1005 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37132] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1005 gene, herein designated VGAM is inhibition of expression of VGAM1005 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1005 correlate with, and may be deduced from, the identity of the target genes which VGAM1005 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37133] HLA-B Associated Transcript 4 (BAT4, Accession NM_033177) is a VGAM1005 host target gene. BAT4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BAT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAT4 BINDING SITE, designated SEQ ID:27040, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37134] A function of VGAM1005 is therefore inhibition of HLA-B Associated Transcript 4 (BAT4, Accession NM_033177). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAT4. Cyclin D2 (CCND2, Accession NM_001759) is another VGAM1005 host target gene. CCND2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7514, to the nucleotide sequence of VGAM1005 RNA,

herein designated VGAM RNA, also designated SEQ ID:3716.

[37135] Another function of VGAM1005 is therefore inhibition of Cyclin D2 (CCND2, Accession NM_001759), a gene which is essential for the control of the cell cycle at the G1/s (start) transition. Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128. Cell Division Cycle 34 (CDC34, Accession NM_004359) is another VGAM1005 host target gene. CDC34 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDC34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC34 BINDING SITE, designated SEQ ID:10561, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37136] Another function of VGAM1005 is therefore inhibition of Cell Division Cycle 34 (CDC34, Accession NM_004359).

Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC34. Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423) is another VGAM1005 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10698, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37137] Another function of VGAM1005 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2,

Pfeiffer syndrome) (FGFR1, Accession NM_015850) is another VGAM1005 host target gene. FGFR1 BINDING SITE1 through FGFR1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE1 through FGFR1 BINDING SITE5, designated SEQ ID:17977, SEQ ID:23361, SEQ ID:23371, SEQ ID:23376 and SEQ ID:6206 respectively, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37138] Another function of VGAM1005 is therefore inhibition of Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM_015850). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR1. Fucosyltransferase 8 (alpha (1,6) Fucosyltransferase) (FUT8, Accession NM_004480) is another VGAM1005 host target gene. FUT8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FUT8, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT8 BINDING SITE, designated SEQ ID:10795, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37139] Another function of VGAM1005 is therefore inhibition of Fucosyltransferase 8 (alpha (1,6) Fucosyltransferase) (FUT8, Accession NM_004480), a gene which transfers fucose to N-linked type complex glycopeptides from GDP-Fuc; functions in asparagine-linked glycoprotein oligosaccharide synthesis. Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT8. The function of FUT8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM64. Glycyl-tRNA Synthetase (GARS, Accession NM_002047) is another VGAM1005 host target gene. GARS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of GARS BINDING SITE, designated SEQ ID:7796, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37140] Another function of VGAM1005 is therefore inhibition of Glycyl-tRNA Synthetase (GARS, Accession NM_002047), a gene which functions in protein biosynthesis. Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARS. The function of GARS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM113. Guanine Nucleotide Binding Protein-like 1 (GNL1, Accession XM_166361) is another VGAM1005 host target gene. GNL1 BINDING SITE1 and GNL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GNL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNL1 BINDING SITE1 and GNL1 BINDING SITE2, designated SEQ ID:44187 and SEQ ID:46716 respectively, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37141] Another function of VGAM1005 is therefore inhibition of Guanine Nucleotide Binding Protein-like 1 (GNL1, Accession XM_166361). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNL1. Hippocalcin-like 1 (HPCAL1, Accession NM_002149) is another VGAM1005 host target gene. HPCAL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HPCAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCAL1 BINDING SITE, designated SEQ ID:7928, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37142] Another function of VGAM1005 is therefore inhibition of Hippocalcin-like 1 (HPCAL1, Accession NM_002149). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL1. Iduronate 2-sulfatase (Hunter syndrome) (IDS, Accession NM_000202) is another VGAM1005 host target gene. IDS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by IDS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDS BINDING SITE, designated SEQ ID:5697, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37143] Another function of VGAM1005 is therefore inhibition of Iduronate 2-sulfatase (Hunter syndrome) (IDS, Accession NM_000202). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDS. Jagged 2 (JAG2, Accession NM_002226) is another VGAM1005 host target gene. JAG2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by JAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAG2 BINDING SITE, designated SEQ ID:8005, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37144] Another function of VGAM1005 is therefore inhibition of Jagged 2 (JAG2, Accession NM_002226), a gene which is a

putative notch ligand involved in the mediation of notch signaling. Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAG2. The function of JAG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM136. Met Proto-oncogene (hepatocyte growth factor receptor) (MET, Accession XM_048918) is another VGAM1005 host target gene. MET BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MET, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MET BINDING SITE, designated SEQ ID:35304, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37145] Another function of VGAM1005 is therefore inhibition of Met Proto-oncogene (hepatocyte growth factor receptor) (MET, Accession XM_048918), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with MET. The function of MET has been established by previous studies. In mammals, 5-prime-terminal caps are formed on nascent pre-mRNAs by the sequential action of 2 enzymes, the bifunctional capping enzyme RNGTT (OMIM Ref. No. 603512) and RNA (guanine-7) methyltransferase. RNGTT catalyzes the removal of the gamma-phosphate of the initiating nucleotide and transfers GMP from GTP to the resulting diphosphate end. RNA (guanine-7) methyltransferase catalyzes the subsequent N7 methylation of the newly formed termini. The terminal 7-methylguanosine is recognized by cap-binding proteins that facilitate key events in gene expression. By searching an EST database for sequences homologous to that of *S. cerevisiae* RNA (guanine-7) methyltransferase, Pillutla et al. (1998) identified a human Met cDNA. The predicted 476-amino acid MET protein contains several conserved motifs known to be required for methyltransferase activity. Recombinant Met exhibited RNA (guanine-7) methyltransferase activity in vitro, and formed ternary complexes with RNGTT and the elongating form of RNA polymerase II. By screening human brain cDNAs for those encoding large proteins, Ishikawa et al. (1997) identified KIAA0398, an RNMT cDNA. Tsukamoto et al. (1998) isolated 3 human

cDNAs encoding mRNA RNMT, which they termed HCMT1a, HCMT1b, and HCMT1c, which appear to be produced by alternative splicing. HCMT1a and HCMT1b encode deduced proteins of 476 and 504 amino acids, respectively, and differ only in the region encoding the C-terminal portion of the enzyme after residue 465. HCMT1c appears to encode the same polypeptide as HCMT1a; however, the 3-prime noncoding region of HCMT1c contains sequences corresponding to portions of both HCMT1a and HCMT1b. RT-PCR detected expression of the 3 mRNAs in all tissues tested. Recombinant HCMT1a expressed in *E. coli* exhibited mRNA RNMT activity, whereas recombinant HCMT1b did not. By analysis of a radiation hybrid panel, Pillutla et al. (1998) and Ishikawa et al. (1997) mapped the RNMT gene to chromosome 18. Pillutla et al. (1998) refined the location to 18p11.23–p11.22 using fluorescence in situ hybridization.

[37146] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37147] Pillutla, R. C.; Yue, Z.; Maldonado, E.; Shatkin, A. J. : Recombinant human mRNA cap methyltransferase binds

capping enzyme/RNA polymerase II complexes. J. Biol. Chem. 273: 21443–21446, 1998. ; and

[37148] Tsukamoto, T.; Shibagaki, Y.; Niikura, Y.; Mizumoto, K. : Cloning and characterization of three human cDNAs encoding mRNA (guanine-7)-methyltransferase, an mRNA cap methylase. Biochem. B.

[37149] Further studies establishing the function and utilities of MET are found in John Hopkins OMIM database record ID 603514, and in cited publications numbered 110 and 1110–1111 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neurexin 1 (NRXN1, Accession NM_138735) is another VGAM1005 host target gene. NRXN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NRXN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRXN1 BINDING SITE, designated SEQ ID:28995, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37150] Another function of VGAM1005 is therefore inhibition of Neurexin 1 (NRXN1, Accession NM_138735), a gene which

may be involved in cell recognition, cell adhesion, and mediate intracellular signaling. Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN1. The function of NRXN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281) is another VGAM1005 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:42837, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37151] Another function of VGAM1005 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN1A.

Solute Carrier Family 30 (zinc transporter), Member 3 (SLC30A3, Accession NM_003459) is another VGAM1005 host target gene. SLC30A3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC30A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC30A3 BINDING SITE, designated SEQ ID:9524, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37152] Another function of VGAM1005 is therefore inhibition of Solute Carrier Family 30 (zinc transporter), Member 3 (SLC30A3, Accession NM_003459). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC30A3. Adaptor-related Protein Complex 1, Sigma 2 Subunit (AP1S2, Accession NM_003916) is another VGAM1005 host target gene. AP1S2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AP1S2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of AP1S2 BINDING SITE, designated SEQ ID:10002, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37153] Another function of VGAM1005 is therefore inhibition of Adaptor-related Protein Complex 1, Sigma 2 Subunit (AP1S2, Accession NM_003916). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S2. Chromosome 22 Open Reading Frame 4 (C22orf4, Accession XM_027143) is another VGAM1005 host target gene. C22orf4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C22orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf4 BINDING SITE, designated SEQ ID:30424, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37154] Another function of VGAM1005 is therefore inhibition of Chromosome 22 Open Reading Frame 4 (C22orf4, Accession XM_027143). Accordingly, utilities of VGAM1005 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf4. CHFR (Accession NM_018223) is another VGAM1005 host target gene. CHFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHFR BINDING SITE, designated SEQ ID:20148, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37155] Another function of VGAM1005 is therefore inhibition of CHFR (Accession NM_018223). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHFR. DKFZp547C176 (Accession XM_040799) is another VGAM1005 host target gene. DKFZp547C176 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp547C176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547C176 BINDING SITE, designated SEQ

ID:33380, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37156] Another function of VGAM1005 is therefore inhibition of DKFZp547C176 (Accession XM_040799). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547C176. DKFZP564I1171 (Accession XM_049568) is another VGAM1005 host target gene. DKFZP564I1171 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP564I1171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I1171 BINDING SITE, designated SEQ ID:35443, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37157] Another function of VGAM1005 is therefore inhibition of DKFZP564I1171 (Accession XM_049568). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I1171. DKFZp761A052 (Accession

XM_054098) is another VGAM1005 host target gene. DKFZp761A052 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761A052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761A052 BINDING SITE, designated SEQ ID:36141, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37158] Another function of VGAM1005 is therefore inhibition of DKFZp761A052 (Accession XM_054098). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761A052. FLJ13262 (Accession NM_024914) is another VGAM1005 host target gene. FLJ13262 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13262 BINDING SITE, designated SEQ ID:24433, to the nucleotide sequence of VGAM1005 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3716.

[37159] Another function of VGAM1005 is therefore inhibition of FLJ13262 (Accession NM_024914). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13262. FLJ20979 (Accession NM_024121) is another VGAM1005 host target gene. FLJ20979 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20979 BINDING SITE, designated SEQ ID:23574, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37160] Another function of VGAM1005 is therefore inhibition of FLJ20979 (Accession NM_024121). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20979. GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568) is another VGAM1005 host target gene. GABARAPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by GABARAPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL3 BINDING SITE, designated SEQ ID:26298, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37161] Another function of VGAM1005 is therefore inhibition of GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL3. KIAA0668 (Accession XM_039332) is another VGAM1005 host target gene. KIAA0668 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0668 BINDING SITE, designated SEQ ID:33048, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37162] Another function of VGAM1005 is therefore inhibition of

KIAA0668 (Accession XM_039332). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0668. KIAA0997 (Accession NM_014950) is another VGAM1005 host target gene. KIAA0997 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0997 BINDING SITE, designated SEQ ID:17281, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37163] Another function of VGAM1005 is therefore inhibition of KIAA0997 (Accession NM_014950). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0997. KIAA1228 (Accession XM_036408) is another VGAM1005 host target gene. KIAA1228 BINDING SITE1 and KIAA1228 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1228, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1228 BINDING SITE1 and KIAA1228 BINDING SITE2, designated SEQ ID:32440 and SEQ ID:32441 respectively, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37164] Another function of VGAM1005 is therefore inhibition of KIAA1228 (Accession XM_036408). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1228. PC4 and SFRS1 Interacting Protein 2 (PSIP2, Accession NM_033222) is another VGAM1005 host target gene. PSIP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PSIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSIP2 BINDING SITE, designated SEQ ID:27067, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37165] Another function of VGAM1005 is therefore inhibition of PC4 and SFRS1 Interacting Protein 2 (PSIP2, Accession NM_033222). Accordingly, utilities of VGAM1005 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PSIP2. Prostaglandin E Synthase 2 (PTGES2, Accession NM_025072) is another VGAM1005 host target gene. PTGES2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTGES2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGES2 BINDING SITE, designated SEQ ID:24669, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37166] Another function of VGAM1005 is therefore inhibition of Prostaglandin E Synthase 2 (PTGES2, Accession NM_025072). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGES2. Rab11-FIP3 (Accession NM_014700) is another VGAM1005 host target gene. Rab11-FIP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by Rab11-FIP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of Rab11–FIP3 BINDING SITE, designated SEQ ID:16227, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37167] Another function of VGAM1005 is therefore inhibition of Rab11–FIP3 (Accession NM_014700). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11–FIP3. RAP2B, Member of RAS Oncogene Family (RAP2B, Accession XM_171061) is another VGAM1005 host target gene. RAP2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAP2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP2B BINDING SITE, designated SEQ ID:45861, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37168] Another function of VGAM1005 is therefore inhibition of RAP2B, Member of RAS Oncogene Family (RAP2B, Accession XM_171061). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with RAP2B. Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144) is another VGAM1005 host target gene. RHOBTB1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RHOBTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB1 BINDING SITE, designated SEQ ID:43951, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37169] Another function of VGAM1005 is therefore inhibition of Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB1. RNA-binding Region (RNP1, RRM) Containing 1 (RNPC1, Accession NM_017495) is another VGAM1005 host target gene. RNPC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RNPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RNPC1 BINDING SITE, designated SEQ ID:18957, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37170] Another function of VGAM1005 is therefore inhibition of RNA-binding Region (RNP1, RRM) Containing 1 (RNPC1, Accession NM_017495). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPC1. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM_006379) is another VGAM1005 host target gene. SEMA3C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3C BINDING SITE, designated SEQ ID:13073, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37171] Another function of VGAM1005 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic

Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM_006379). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3C. Williams–Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM_025042) is another VGAM1005 host target gene. WBSCR23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WBSCR23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR23 BINDING SITE, designated SEQ ID:24638, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37172] Another function of VGAM1005 is therefore inhibition of Williams–Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM_025042). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR23. LOC133308 (Accession XM_059638) is another VGAM1005 host target gene. LOC133308 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC133308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133308 BINDING SITE, designated SEQ ID:37035, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37173] Another function of VGAM1005 is therefore inhibition of LOC133308 (Accession XM_059638). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133308. LOC134145 (Accession XM_059691) is another VGAM1005 host target gene. LOC134145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC134145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134145 BINDING SITE, designated SEQ ID:37062, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37174] Another function of VGAM1005 is therefore inhibition of LOC134145 (Accession XM_059691). Accordingly, utilities

of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134145. LOC143915 (Accession XM_096502) is another VGAM1005 host target gene. LOC143915 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143915 BINDING SITE, designated SEQ ID:40377, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37175] Another function of VGAM1005 is therefore inhibition of LOC143915 (Accession XM_096502). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143915. LOC145481 (Accession XM_085163) is another VGAM1005 host target gene. LOC145481 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145481 BINDING SITE, designated SEQ ID:37890, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37176] Another function of VGAM1005 is therefore inhibition of LOC145481 (Accession XM_085163). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145481. LOC146894 (Accession NM_145273) is another VGAM1005 host target gene. LOC146894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146894 BINDING SITE, designated SEQ ID:29781, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37177] Another function of VGAM1005 is therefore inhibition of LOC146894 (Accession NM_145273). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146894. LOC148709 (Accession XM_086281) is another VGAM1005 host target gene. LOC148709 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148709 BINDING SITE, designated SEQ ID:38583, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37178] Another function of VGAM1005 is therefore inhibition of LOC148709 (Accession XM_086281). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148709. LOC149297 (Accession XM_097622) is another VGAM1005 host target gene. LOC149297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149297 BINDING SITE, designated SEQ ID:40979, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37179] Another function of VGAM1005 is therefore inhibition of

LOC149297 (Accession XM_097622). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149297. LOC151127 (Accession XM_087104) is another VGAM1005 host target gene. LOC151127 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151127 BINDING SITE, designated SEQ ID:39061, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37180] Another function of VGAM1005 is therefore inhibition of LOC151127 (Accession XM_087104). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151127. LOC153474 (Accession XM_087684) is another VGAM1005 host target gene. LOC153474 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC153474 BINDING SITE, designated SEQ ID:39379, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37181] Another function of VGAM1005 is therefore inhibition of LOC153474 (Accession XM_087684). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153474. LOC153505 (Accession XM_087693) is another VGAM1005 host target gene. LOC153505 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153505 BINDING SITE, designated SEQ ID:39382, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37182] Another function of VGAM1005 is therefore inhibition of LOC153505 (Accession XM_087693). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153505. LOC164537 (Accession XM_104534) is an-

other VGAM1005 host target gene. LOC164537 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164537 BINDING SITE, designated SEQ ID:42172, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37183] Another function of VGAM1005 is therefore inhibition of LOC164537 (Accession XM_104534). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164537. LOC219513 (Accession XM_169166) is another VGAM1005 host target gene. LOC219513 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219513 BINDING SITE, designated SEQ ID:45294, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37184] Another function of VGAM1005 is therefore inhibition of LOC219513 (Accession XM_169166). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219513. LOC221938 (Accession XM_166542) is another VGAM1005 host target gene. LOC221938 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221938 BINDING SITE, designated SEQ ID:44513, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37185] Another function of VGAM1005 is therefore inhibition of LOC221938 (Accession XM_166542). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221938. LOC255104 (Accession XM_170911) is another VGAM1005 host target gene. LOC255104 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255104, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255104 BINDING SITE, designated SEQ ID:45684, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37186] Another function of VGAM1005 is therefore inhibition of LOC255104 (Accession XM_170911). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255104. LOC257541 (Accession XM_175175) is another VGAM1005 host target gene. LOC257541 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257541, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257541 BINDING SITE, designated SEQ ID:46671, to the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, also designated SEQ ID:3716.

[37187] Another function of VGAM1005 is therefore inhibition of LOC257541 (Accession XM_175175). Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC257541. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1006 (VGAM1006) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37188] VGAM1006 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1006 was detected is described hereinabove with reference to Figs. 1–8.

[37189] VGAM1006 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1006 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37190] VGAM1006 gene encodes a VGAM1006 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1006 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1006 precursor RNA is designated SEQ ID:992, and is provided hereinbelow with refer–

ence to the sequence listing part. Nucleotide sequence SEQ ID:992 is located at position 197086 relative to the genome of Chimpanzee Cytomegalovirus.

- [37191] VGAM1006 precursor RNA folds onto itself, forming VGAM1006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [37192] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1006 folded precursor RNA into VGAM1006 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1006 RNA is designated SEQ ID:3717, and is provided hereinbelow with reference to the sequence listing part.

[37193] VGAM1006 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1006 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1006 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37194] VGAM1006 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1006 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1006 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1006 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1006 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37195] The complementary binding of VGAM1006 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1006 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1006 host target RNA into VGAM1006 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37196] It is appreciated that VGAM1006 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1006 host target genes. The mRNA of each one of this plurality of VGAM1006 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1006 RNA, herein designated VGAM RNA, and which when bound by VGAM1006 RNA causes

inhibition of translation of respective one or more VGAM1006 host target proteins.

[37197] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1006 gene, herein designated VGAM GENE, on one or more VGAM1006 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37198] It is yet further appreciated that a function of VGAM1006 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1006 include diagnosis, prevention and

treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1006 correlate with, and may be deduced from, the identity of the host target genes which VGAM1006 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37199] Nucleotide sequences of the VGAM1006 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1006 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1006 are further described hereinbelow with reference to Table 1.

[37200] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1006 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1006 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37201] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1006 gene, herein designated VGAM is inhibition of expression of VGAM1006 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1006 correlate with, and may be deduced from, the identity of the target genes which VGAM1006 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37202] Acyl-Coenzyme A Dehydrogenase, C-4 to C-12 Straight Chain (ACADM, Accession NM_000016) is a VGAM1006 host target gene. ACADM BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ACADM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACADM BINDING SITE, designated SEQ ID:5451, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37203] A function of VGAM1006 is therefore inhibition of Acyl-Coenzyme A Dehydrogenase, C-4 to C-12 Straight Chain (ACADM, Accession NM_000016). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADM. AF5Q31 (Accession NM_014423) is another VGAM1006 host target gene. AF5Q31 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AF5Q31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF5Q31 BINDING SITE, designated SEQ ID:15777, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37204] Another function of VGAM1006 is therefore inhibition of AF5Q31 (Accession NM_014423). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF5Q31. Asialoglycoprotein Receptor 2 (ASGR2, Accession NM_080912) is another VGAM1006 host target gene. ASGR2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ASGR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASGR2 BINDING SITE, designated SEQ ID:28130, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37205] Another function of VGAM1006 is therefore inhibition of Asialoglycoprotein Receptor 2 (ASGR2, Accession NM_080912). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASGR2. BarH-like 1 (Drosophila) (BARHL1, Accession NM_020064) is another VGAM1006 host target gene. BARHL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BARHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BARHL1 BINDING SITE, designated SEQ ID:21300, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37206] Another function of VGAM1006 is therefore inhibition of BarH-like 1 (Drosophila) (BARHL1, Accession NM_020064), a gene which controls the expression of neural adhesion molecules. Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BARHL1. The function of BARHL1 has been established by previous studies. The BarH1 and BarH2 (Bar) Drosophila genes are homeobox-

containing genes, which are required for the fate determination of external sensory organs in the fly. Using a bioinformatic approach, Bulfone et al. (2000) identified murine and human homeobox genes highly related to the Bar *Drosophila* genes, which they designated Barhl1 and Barhl2 (OMIM Ref. No. 605212). Bulfone et al. (2000) screened a human lambda genomic library and identified a clone containing the last 2 exons of the BARHL1 gene. By joining these 2 exons together, they obtained a partial BARHL1 sequence (GenBank AJ237816) containing the homeobox and stop codon. This partial BARHL1 sequence and the corresponding mouse sequence share 99% amino acid identity. The mouse Barhl1 gene is more highly homologous to *Drosophila* BARH1 than is the murine Barx1 gene (OMIM Ref. No. 603260). In situ hybridization to mouse tissues at several developmental stages revealed that Barhl1 is exclusively expressed in restricted domains of the developing central nervous system, in particular the diencephalon and rhombencephalon, where it is expressed in migrating cells giving rise to the cerebellar external granular layer and to specific populations of dorsal sensory interneurons of the spinal cord. The authors hypothesized that Barhl1 function may be required for the

generation of these specific subtypes of neuronal progenitors. Bulfone et al. (2000) stated that the mapping assignment and the expression pattern make BARHL1 a positional candidate gene for a form of Joubert syndrome (OMIM Ref. No. 213300), a rare developmental anomaly of the cerebellum in humans. Blair et al. (2002) appeared to have excluded BARHL1 as the site of the mutation in the form of Joubert syndrome that is linked to 9q34.

[37207] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37208] Bulfone, A.; Menguzzato, E.; Broccoli, V.; Marchitello, A.; Gattuso, C.; Mariani, M.; Consalez, G. G.; Martinez, S.; Bal-labio, A.; Banfi, S. : Barhl1, a gene belonging to a new subfamily of mammalian homeobox genes, is expressed in migrating neurons of the CNS. Hum. Molec. Genet. 9: 1443–1452, 2000. ; and

[37209] Blair, I. P.; Gibson, R. R.; Bennett, C. L.; Chance, P. F. : Search for genes involved in Joubert syndrome: evidence that one or more major loci are yet to be identified and exclusion o.

[37210] Further studies establishing the function and utilities of BARHL1 are found in John Hopkins OMIM database record

ID 605211, and in cited publications numbered 9538 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CGTHBA (Accession NM_012075) is another VGAM1006 host target gene. CGTHBA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGTHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGTHBA BINDING SITE, designated SEQ ID:14362, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37211] Another function of VGAM1006 is therefore inhibition of CGTHBA (Accession NM_012075). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGTHBA. Cysteine Knot Superfamily 1, BMP Antagonist 1 (CKTSF1B1, Accession NM_013372) is another VGAM1006 host target gene. CKTSF1B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CKTSF1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKTSF1B1 BINDING SITE, designated SEQ ID:15021, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37212] Another function of VGAM1006 is therefore inhibition of Cysteine Knot Superfamily 1, BMP Antagonist 1 (CKTSF1B1, Accession NM_013372), a gene which blocks signaling of bone morphogenetic protein (BMP) . Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKTSF1B1. The function of CKTSF1B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28.Espin (ESPN, Accession NM_031475) is another VGAM1006 host target gene. ESPN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESPN BINDING SITE, designated SEQ ID:25549, to the nucleotide sequence of VGAM1006 RNA, herein designated

VGAM RNA, also designated SEQ ID:3717.

[37213] Another function of VGAM1006 is therefore inhibition of Espin (ESPN, Accession NM_031475), a gene which a membrane-cytoskeletal assemblages . Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESPN. The function of ESPN has been established by previous studies. Ectoplasmic specializations are membrane-cytoskeletal assemblages found in Sertoli cells at sites of attachment to elongate spermatids or neighboring Sertoli cells. Bartles et al. (1996) identified the rat actin-bundling protein espin, which is localized to ectoplasmic specializations. The 836-amino acid espin protein had a molecular mass of approximately 110 kD in SDS gels. Northern blot analysis detected a 2.9-kb espin transcript only in rat testis; a minor 1.7-kb transcript was detected in small intestine and kidney. Bartles et al. (1998) identified a 30-kD, 253-amino acid isoform of rat espin that localized to brush border microvilli in the intestine and kidney. Espin and small espin share a 167-amino acid C-terminal peptide that includes a 116-amino acid C-terminal actin-bundling module that is necessary and sufficient for actin bundle formation in vitro; however, they

contain different N termini. Bartles et al. (1998) and Chen et al. (1999) determined that unlike many actin-bundling proteins, the rat espins bind actin filaments with high affinity, and their actin-bundling activities are not inhibited by calcium. Zheng et al. (2000) determined that espins are present in hair cell stereocilia and uncovered a connection between the espin gene and jerker mouse, a recessive mutation that causes hair cell degeneration, deafness, and vestibular dysfunction. The tissues of jerker mice did not accumulate espin proteins but contained normal levels of espin mRNAs. The authors identified a frameshift mutation in the espin gene of jerker mice that affected the espin C-terminal actin-bundling module. These data suggested that jerker mice are espin null and that the jerker phenotype results from a mutation in the espin gene. Animal model experiments lend further support to the function of ESPN. Zheng et al. (2000) determined that espins are present in hair cell stereocilia and uncovered a connection between the espin gene and jerker mouse, a recessive mutation that causes hair cell degeneration, deafness, and vestibular dysfunction. The tissues of jerker mice did not accumulate espin proteins but contained normal levels of espin mRNAs. The authors

identified a frameshift mutation in the espin gene of jerker mice that affected the espin C-terminal actin-bundling module. These data suggested that jerker mice are espin null and that the jerker phenotype results from a mutation in the espin gene.

[37214] It is appreciated that the abovementioned animal model for ESPN is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[37215] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37216] Chen, B.; Li, A.; Wang, D.; Wang, M.; Zheng, L.; Bartles, J. R. : Espin contains an additional actin-binding site in its N terminus and is a major actin-bundling protein of the Sertoli cell-spermatid ectoplasmic specialization junctional plaque. *Molec. Biol. Cell* 10: 4327-4339, 1999. ; and

[37217] Zheng, L.; Sekerkova, G.; Vranich, K.; Tilney, L. G.; Mugnaini, E.; Bartles, J. R. : The deaf jerker mouse has a mutation in the gene encoding the espin actin-bundling proteins of hair.

[37218] Further studies establishing the function and utilities of ESPN are found in John Hopkins OMIM database record ID

606351, and in cited publications numbered 6421–6424 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glypican 1 (GPC1, Accession NM_002081) is another VGAM1006 host target gene. GPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPC1 BINDING SITE, designated SEQ ID:7872, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37219] Another function of VGAM1006 is therefore inhibition of Glypican 1 (GPC1, Accession NM_002081), a gene which may play a role in growth control and differentiation. Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC1. The function of GPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. HTRA3 (Accession XM_114416) is another VGAM1006 host target gene. HTRA3 BINDING SITE is HOST TARGET binding site found

in the 5' untranslated region of mRNA encoded by HTRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTRA3 BINDING SITE, designated SEQ ID:42941, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37220] Another function of VGAM1006 is therefore inhibition of HTRA3 (Accession XM_114416). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTRA3. Insulin-like Growth Factor 2 (somatomedin A) (IGF2, Accession NM_000612) is another VGAM1006 host target gene. IGF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF2 BINDING SITE, designated SEQ ID:6215, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37221] Another function of VGAM1006 is therefore inhibition of

Insulin-like Growth Factor 2 (somatomedin A) (IGF2, Accession NM_000612). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF2. Kinesin Family Member C3 (KIFC3, Accession NM_005550) is another VGAM1006 host target gene. KIFC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIFC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIFC3 BINDING SITE, designated SEQ ID:12082, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37222] Another function of VGAM1006 is therefore inhibition of Kinesin Family Member C3 (KIFC3, Accession NM_005550), a gene which may function in intracellular transport and mitosis. Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIFC3. The function of KIFC3 has been established by previous studies. Kinesins comprise a large superfamily of molecular motors that use the energy of ATP hydrolysis to translocate

cargoes along microtubules. Members share extensive homology within a globular domain containing the microtubule- and ATP-binding sites and have a coiled-coil stalk domain that mediates oligomerization. Different kinesin family members participate in specific and diverse motile processes, such as cell division, organelle transport, and nuclear movement. Motile processes are essential to the function, morphogenesis, and maintenance of photoreceptors and the retinal pigment epithelium (RPE). By PCR of human retina cDNA using degenerate oligonucleotides based on highly conserved sequences in the kinesin motor domain, Hoang et al. (1998) isolated cDNAs encoding 4 different kinesin family members, including KIFC3. KIFC3 is highly homologous to mouse *Kifc3* and Morone saxatilis (striped bass) FKIF2, which was the most abundant kinesin identified in both the retina and RPE (Bost-Usinger et al., 1997). The predicted 687-amino acid KIFC3 protein contains the highly conserved ATP/GTP-binding site, or P-loop, and kinesin motor domain. In contrast to conventional kinesin and kinesin families that have N-terminal motor domains, the motor domains of human KIFC3, mouse *Kifc3*, and FKIF2 are predicted to reside at the C-terminal end; such kinesins are termed C-kinesins. An an-

tibody raised against FKIF2 recognized an approximately 80-kD protein in human retina, RPE, kidney, and lung

[37223] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37224] Bost-Usinger, L.; Chen, R. J.; Hillman, D.; Park, P.; Burnside, B. : Multiple kinesin family members expressed in teleost retina and RPE include a novel C-terminal kinesin. *Exp. Eye Res.* 64: 781–794, 1997. ; and

[37225] Hoang, E. H.; Whitehead, J. L.; Dose, A. C.; Burnside, B. : Cloning of a novel C-terminal kinesin (KIFC3) that maps to human chromosome 16q13–q21 and thus is a candidate gene for Bardet.

[37226] Further studies establishing the function and utilities of KIFC3 are found in John Hopkins OMIM database record ID 604535, and in cited publications numbered 7462–7463 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Notch Homolog 3 (Drosophila) (NOTCH3, Accession NM_000435) is another VGAM1006 host target gene. NOTCH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NOTCH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOTCH3 BINDING SITE, designated SEQ ID:6016, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37227] Another function of VGAM1006 is therefore inhibition of Notch Homolog 3 (Drosophila) (NOTCH3, Accession NM_000435), a gene which may function in cell fate specification during development. Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOTCH3. The function of NOTCH3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128.PACE (Accession NM_002569) is another VGAM1006 host target gene. PACE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE BINDING SITE, designated SEQ ID:8426, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA,

also designated SEQ ID:3717.

[37228] Another function of VGAM1006 is therefore inhibition of PACE (Accession NM_002569), a gene which processes pro-parathyroid hormone, pro-transforming growth factor beta. Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE. The function of PACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM151. Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM_166424) is another VGAM1006 host target gene. PACSIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACSIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN1 BINDING SITE, designated SEQ ID:44310, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37229] Another function of VGAM1006 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 1

(PACSIN1, Accession XM_166424). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN1. Retinoic Acid Receptor, Alpha (RARA, Accession NM_000964) is another VGAM1006 host target gene. RARA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RARA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RARA BINDING SITE, designated SEQ ID:6688, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37230] Another function of VGAM1006 is therefore inhibition of Retinoic Acid Receptor, Alpha (RARA, Accession NM_000964). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARA. RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799) is another VGAM1006 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9885, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37231] Another function of VGAM1006 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Receptor Tyrosine Kinase-like Orphan Receptor 2 (ROR2, Accession NM_004560) is another VGAM1006 host target gene. ROR2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ROR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROR2 BINDING SITE, designated SEQ ID:10898, to the nucleotide sequence of

VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37232] Another function of VGAM1006 is therefore inhibition of Receptor Tyrosine Kinase-like Orphan Receptor 2 (ROR2, Accession NM_004560), a gene which may be involved in the early formayion of the chonrocytes. Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROR2. The function of ROR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232.Cat Eye Syndrome Chromosome Region, Candidate 2 (CECR2, Accession NM_031413) is another VGAM1006 host target gene. CECR2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CECR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR2 BINDING SITE, designated SEQ ID:25393, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37233] Another function of VGAM1006 is therefore inhibition of

Cat Eye Syndrome Chromosome Region, Candidate 2 (CECR2, Accession NM_031413). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR2. CEP3 (Accession NM_006449) is another VGAM1006 host target gene. CEP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CEP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP3 BINDING SITE, designated SEQ ID:13158, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37234] Another function of VGAM1006 is therefore inhibition of CEP3 (Accession NM_006449). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP3. DKFZP434H132 (Accession XM_057020) is another VGAM1006 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434H132, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:36449, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37235] Another function of VGAM1006 is therefore inhibition of DKFZP434H132 (Accession XM_057020). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. DKFZp547M072 (Accession XM_028067) is another VGAM1006 host target gene. DKFZp547M072 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547M072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547M072 BINDING SITE, designated SEQ ID:30616, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37236] Another function of VGAM1006 is therefore inhibition of DKFZp547M072 (Accession XM_028067). Accordingly,

utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547M072. DKFZp586I021 (Accession NM_032271) is another VGAM1006 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26026, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37237] Another function of VGAM1006 is therefore inhibition of DKFZp586I021 (Accession NM_032271). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. FLJ10743 (Accession NM_018201) is another VGAM1006 host target gene. FLJ10743 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ10743 BINDING SITE, designated SEQ ID:20079, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37238] Another function of VGAM1006 is therefore inhibition of FLJ10743 (Accession NM_018201). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10743. FLJ14810 (Accession NM_032843) is another VGAM1006 host target gene. FLJ14810 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14810 BINDING SITE, designated SEQ ID:26635, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37239] Another function of VGAM1006 is therefore inhibition of FLJ14810 (Accession NM_032843). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14810. FLJ21438 (Accession XM_029084) is another

VGAM1006 host target gene. FLJ21438 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21438 BINDING SITE, designated SEQ ID:30848, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37240] Another function of VGAM1006 is therefore inhibition of FLJ21438 (Accession XM_029084). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21438. FLJ22215 (Accession NM_022834) is another VGAM1006 host target gene. FLJ22215 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22215 BINDING SITE, designated SEQ ID:23117, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37241] Another function of VGAM1006 is therefore inhibition of FLJ22215 (Accession NM_022834). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22215. KIAA0258 (Accession NM_014785) is another VGAM1006 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16647, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37242] Another function of VGAM1006 is therefore inhibition of KIAA0258 (Accession NM_014785). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. KIAA0552 (Accession NM_014731) is another VGAM1006 host target gene. KIAA0552 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0552, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0552 BINDING SITE, designated SEQ ID:16348, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37243] Another function of VGAM1006 is therefore inhibition of KIAA0552 (Accession NM_014731). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0552. KIAA0618 (Accession NM_014833) is another VGAM1006 host target gene. KIAA0618 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0618 BINDING SITE, designated SEQ ID:16834, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37244] Another function of VGAM1006 is therefore inhibition of KIAA0618 (Accession NM_014833). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0618. KIAA1530 (Accession XM_042661) is another VGAM1006 host target gene. KIAA1530 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:33734, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37245] Another function of VGAM1006 is therefore inhibition of KIAA1530 (Accession XM_042661). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530. MCLC (Accession NM_015127) is another VGAM1006 host target gene. MCLC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCLC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCLC BINDING SITE, designated SEQ ID:17492, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3717.

[37246] Another function of VGAM1006 is therefore inhibition of MCLC (Accession NM_015127). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCLC. QKI (Accession XM_037438) is another VGAM1006 host target gene. QKI BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by QKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of QKI BINDING SITE, designated SEQ ID:32617, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37247] Another function of VGAM1006 is therefore inhibition of QKI (Accession XM_037438). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with QKI. RBAK (Accession NM_021163) is another VGAM1006 host target gene. RBAK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RBAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RBAK BINDING SITE, designated SEQ ID:22141, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37248] Another function of VGAM1006 is therefore inhibition of RBAK (Accession NM_021163). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBAK. LOC116113 (Accession XM_166413) is another VGAM1006 host target gene. LOC116113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116113 BINDING SITE, designated SEQ ID:44287, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37249] Another function of VGAM1006 is therefore inhibition of LOC116113 (Accession XM_166413). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC116113. LOC145547 (Accession XM_085167) is another VGAM1006 host target gene. LOC145547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145547 BINDING SITE, designated SEQ ID:37893, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37250] Another function of VGAM1006 is therefore inhibition of LOC145547 (Accession XM_085167). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145547. LOC221424 (Accession XM_168060) is another VGAM1006 host target gene. LOC221424 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221424 BINDING SITE, designated SEQ ID:44979, to the nucleotide sequence of VGAM1006 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3717.

[37251] Another function of VGAM1006 is therefore inhibition of LOC221424 (Accession XM_168060). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221424. LOC221486 (Accession XM_165760) is another VGAM1006 host target gene. LOC221486 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221486 BINDING SITE, designated SEQ ID:43743, to the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, also designated SEQ ID:3717.

[37252] Another function of VGAM1006 is therefore inhibition of LOC221486 (Accession XM_165760). Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221486. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1007 (VGAM1007) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37253] VGAM1007 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1007 was detected is described hereinabove with reference to Figs. 1–8.

[37254] VGAM1007 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1007 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37255] VGAM1007 gene encodes a VGAM1007 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1007 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1007 precursor RNA is designated SEQ ID:993, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:993 is located at position 200001 relative to the genome of Chimpanzee Cytomegalovirus.

[37256] VGAM1007 precursor RNA folds onto itself, forming

VGAM1007 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37257] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1007 folded precursor RNA into VGAM1007 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1007 RNA is designated SEQ ID:3718, and is provided hereinbelow with reference to the sequence listing part.

[37258] VGAM1007 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1007 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1007 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37259] VGAM1007 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1007 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1007 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1007 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1007 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37260] The complementary binding of VGAM1007 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1007 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1007 host target RNA into VGAM1007 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37261] It is appreciated that VGAM1007 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1007 host target genes. The mRNA of each one of this plurality of VGAM1007 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1007 RNA, herein designated VGAM RNA, and which when bound by VGAM1007 RNA causes inhibition of translation of respective one or more VGAM1007 host target proteins.

[37262] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1007 gene, herein designated VGAM GENE, on one or more VGAM1007 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37263] It is yet further appreciated that a function of VGAM1007 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1007 correlate with, and may be deduced from, the identity of the host target genes which

VGAM1007 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37264] Nucleotide sequences of the VGAM1007 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1007 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1007 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1007 are further described hereinbelow with reference to Table 1.

[37265] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1007 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1007 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37266] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1007 gene, herein designated VGAM is inhibition of expression of VGAM1007 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1007 correlate with, and may be deduced from, the identity of the target genes which VGAM1007 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[37267] E1A Binding Protein P300 (EP300, Accession NM_001429) is a VGAM1007 host target gene. EP300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EP300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EP300 BINDING SITE, designated SEQ ID:7150, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37268] A function of VGAM1007 is therefore inhibition of E1A Binding Protein P300 (EP300, Accession NM_001429), a gene which may have a function in cell cycle regulation. Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EP300. The function of EP300 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. GRB2-associated Binding Protein 2 (GAB2, Accession NM_012296) is another VGAM1007 host target gene. GAB2 BINDING SITE1 and GAB2 BINDING SITE2 are HOST TARGET binding sites

found in untranslated regions of mRNA encoded by GAB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE1 and GAB2 BINDING SITE2, designated SEQ ID:14653 and SEQ ID:27848 respectively, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37269] Another function of VGAM1007 is therefore inhibition of GRB2-associated Binding Protein 2 (GAB2, Accession NM_012296), a gene which act as adapters for transmitting various signals. Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2. The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53. Transducin (beta)-like 2 (TBL2, Accession NM_032988) is another VGAM1007 host target gene. TBL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TBL2 BINDING SITE, designated SEQ ID:26869, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37270] Another function of VGAM1007 is therefore inhibition of Transducin (beta)-like 2 (TBL2, Accession NM_032988), a gene which is of unknown function. Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL2. The function of TBL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229. Calneuron 1 (CALN1, Accession NM_031468) is another VGAM1007 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25516, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37271] Another function of VGAM1007 is therefore inhibition of Calneuron 1 (CALN1, Accession NM_031468). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_033332) is another VGAM1007 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:27168, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37272] Another function of VGAM1007 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_033332). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. DGS-A (Accession XM_097827) is another VGAM1007 host target gene. DGS-A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by DGS-A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGS-A BINDING SITE, designated SEQ ID:41149, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37273] Another function of VGAM1007 is therefore inhibition of DGS-A (Accession XM_097827). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGS-A. DKFZP761E2110 (Accession NM_030953) is another VGAM1007 host target gene. DKFZP761E2110 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP761E2110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761E2110 BINDING SITE, designated SEQ ID:25226, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37274] Another function of VGAM1007 is therefore inhibition of

DKFZP761E2110 (Accession NM_030953). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761E2110. HCCA2 (Accession XM_039894) is another VGAM1007 host target gene. HCCA2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HCCA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCCA2 BINDING SITE, designated SEQ ID:33205, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37275] Another function of VGAM1007 is therefore inhibition of HCCA2 (Accession XM_039894). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCCA2. KIAA0449 (Accession NM_017596) is another VGAM1007 host target gene. KIAA0449 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0449 BINDING SITE, designated SEQ ID:19053, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37276] Another function of VGAM1007 is therefore inhibition of KIAA0449 (Accession NM_017596). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0449. KIAA0596 (Accession XM_031706) is another VGAM1007 host target gene. KIAA0596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0596 BINDING SITE, designated SEQ ID:31462, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37277] Another function of VGAM1007 is therefore inhibition of KIAA0596 (Accession XM_031706). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0596. KIAA0599 (Accession XM_085127) is another

VGAM1007 host target gene. KIAA0599 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:37858, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37278] Another function of VGAM1007 is therefore inhibition of KIAA0599 (Accession XM_085127). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0599. KIAA1283 (Accession XM_050563) is another VGAM1007 host target gene. KIAA1283 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1283 BINDING SITE, designated SEQ ID:35663, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37279] Another function of VGAM1007 is therefore inhibition of KIAA1283 (Accession XM_050563). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1283. MGC2217 (Accession NM_024300) is another VGAM1007 host target gene. MGC2217 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2217 BINDING SITE, designated SEQ ID:23589, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37280] Another function of VGAM1007 is therefore inhibition of MGC2217 (Accession NM_024300). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2217. LOC114932 (Accession XM_052614) is another VGAM1007 host target gene. LOC114932 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC114932, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114932 BINDING SITE, designated SEQ ID:36006, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37281] Another function of VGAM1007 is therefore inhibition of LOC114932 (Accession XM_052614). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114932. LOC159036 (Accession XM_099018) is another VGAM1007 host target gene. LOC159036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159036 BINDING SITE, designated SEQ ID:42053, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37282] Another function of VGAM1007 is therefore inhibition of LOC159036 (Accession XM_099018). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC159036. LOC201595 (Accession XM_114346) is another VGAM1007 host target gene. LOC201595 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201595, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201595 BINDING SITE, designated SEQ ID:42886, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37283] Another function of VGAM1007 is therefore inhibition of LOC201595 (Accession XM_114346). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201595. LOC222662 (Accession XM_167086) is another VGAM1007 host target gene. LOC222662 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222662 BINDING SITE, designated SEQ ID:44603, to the nucleotide sequence of VGAM1007 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3718.

[37284] Another function of VGAM1007 is therefore inhibition of LOC222662 (Accession XM_167086). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222662. LOC256586 (Accession XM_170759) is another VGAM1007 host target gene. LOC256586 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256586, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256586 BINDING SITE, designated SEQ ID:45515, to the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, also designated SEQ ID:3718.

[37285] Another function of VGAM1007 is therefore inhibition of LOC256586 (Accession XM_170759). Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256586. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1008 (VGAM1008) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37286] VGAM1008 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1008 was detected is described hereinabove with reference to Figs. 1-8.

[37287] VGAM1008 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1008 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37288] VGAM1008 gene encodes a VGAM1008 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1008 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1008 precursor RNA is designated SEQ ID:994, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:994 is located at position 199188 relative to the genome of Chimpanzee Cytomegalovirus.

[37289] VGAM1008 precursor RNA folds onto itself, forming

VGAM1008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37290] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1008 folded precursor RNA into VGAM1008 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1008 RNA is designated SEQ ID:3719, and is provided hereinbelow with reference to the sequence listing part.

[37291] VGAM1008 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1008 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1008 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37292] VGAM1008 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1008 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1008 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1008 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1008 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37293] The complementary binding of VGAM1008 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1008 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1008 host target RNA into VGAM1008 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37294] It is appreciated that VGAM1008 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1008 host target genes. The mRNA of each one of this plurality of VGAM1008 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1008 RNA, herein designated VGAM RNA, and which when bound by VGAM1008 RNA causes inhibition of translation of respective one or more VGAM1008 host target proteins.

[37295] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1008 gene, herein designated VGAM GENE, on one or more VGAM1008 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37296] It is yet further appreciated that a function of VGAM1008 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1008 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1008 correlate with, and may be deduced from, the identity of the host target genes which

VGAM1008 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37297] Nucleotide sequences of the VGAM1008 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1008 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1008 are further described hereinbelow with reference to Table 1.

[37298] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1008 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1008 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37299] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1008 gene, herein designated VGAM is inhibition of expression of VGAM1008 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1008 correlate with, and may be deduced from, the identity of the target genes which VGAM1008 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[37300] Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM_002507) is a VGAM1008 host target gene. NGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGFR BINDING SITE, designated SEQ ID:8336, to the nucleotide sequence of VGAM1008 RNA, herein designated VGAM RNA, also designated SEQ ID:3719.

[37301] A function of VGAM1008 is therefore inhibition of Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM_002507), a gene which can mediate cell survival as well as cell death of neural cells. Accordingly, utilities of VGAM1008 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFR. The function of NGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM212. Optic Atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Ac-

cession NM_025136) is another VGAM1008 host target gene. OPA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPA3 BINDING SITE, designated SEQ ID:24775, to the nucleotide sequence of VGAM1008 RNA, herein designated VGAM RNA, also designated SEQ ID:3719.

[37302] Another function of VGAM1008 is therefore inhibition of Optic Atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Accession NM_025136). Accordingly, utilities of VGAM1008 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA3. KIAA0447 (Accession XM_049733) is another VGAM1008 host target gene. KIAA0447 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0447 BINDING SITE, designated SEQ ID:35492, to the nucleotide sequence of VGAM1008 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3719.

[37303] Another function of VGAM1008 is therefore inhibition of KIAA0447 (Accession XM_049733). Accordingly, utilities of VGAM1008 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0447. Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635) is another VGAM1008 host target gene. P2RX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RX1 BINDING SITE, designated SEQ ID:33353, to the nucleotide sequence of VGAM1008 RNA, herein designated VGAM RNA, also designated SEQ ID:3719.

[37304] Another function of VGAM1008 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635). Accordingly, utilities of VGAM1008 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX1. Ubiquitin Specific Protease 22 (USP22, Accession XM_042698) is another VGAM1008 host target gene.

USP22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP22 BINDING SITE, designated SEQ ID:33752, to the nucleotide sequence of VGAM1008 RNA, herein designated VGAM RNA, also designated SEQ ID:3719.

[37305] Another function of VGAM1008 is therefore inhibition of Ubiquitin Specific Protease 22 (USP22, Accession XM_042698). Accordingly, utilities of VGAM1008 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP22. LOC146229 (Accession XM_085387) is another VGAM1008 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38118, to the nucleotide sequence of VGAM1008 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3719.

[37306] Another function of VGAM1008 is therefore inhibition of LOC146229 (Accession XM_085387). Accordingly, utilities of VGAM1008 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1009 (VGAM1009) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37307] VGAM1009 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1009 was detected is described hereinabove with reference to Figs. 1–8.

[37308] VGAM1009 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 4. VGAM1009 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37309] VGAM1009 gene encodes a VGAM1009 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1009 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1009 precursor RNA is designated SEQ ID:995, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:995 is located at position 31121 relative to the genome of Equine Herpesvirus 4.

- [37310] VGAM1009 precursor RNA folds onto itself, forming VGAM1009 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [37311] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1009 folded precursor RNA into VGAM1009 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1009 RNA is designated SEQ ID:3720, and is provided hereinbelow with reference to the sequence listing part.

[37312] VGAM1009 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1009 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1009 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37313] VGAM1009 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1009 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1009 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1009 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1009 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37314] The complementary binding of VGAM1009 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1009 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1009 host target RNA into VGAM1009 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37315] It is appreciated that VGAM1009 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1009 host target genes. The mRNA of

each one of this plurality of VGAM1009 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1009 RNA, herein designated VGAM RNA, and which when bound by VGAM1009 RNA causes inhibition of translation of respective one or more VGAM1009 host target proteins.

[37316] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1009 gene, herein designated VGAM GENE, on one or more VGAM1009 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[37317] It is yet further appreciated that a function of VGAM1009 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1009 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1009 correlate with, and may be deduced from, the identity of the host target genes which VGAM1009 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37318] Nucleotide sequences of the VGAM1009 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1009 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1009 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1009 are further described hereinbelow with reference to Table 1.

[37319] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1009 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1009 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37320] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1009 gene, herein designated VGAM is inhibition of expression of VGAM1009 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1009 correlate with, and may be deduced from, the identity of the target genes which VGAM1009 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37321] Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275) is a VGAM1009 host target gene. IL1F5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1F5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F5 BINDING SITE, designated SEQ ID:14599, to the nucleotide sequence of VGAM1009 RNA, herein designated VGAM RNA, also designated SEQ ID:3720.

[37322] A function of VGAM1009 is therefore inhibition of Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275), a gene which is a novel interleukin-1 recep-

tor antagonist gene. Accordingly, utilities of VGAM1009 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F5. The function of IL1F5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM263.NBR2 (Accession NM_005821) is another VGAM1009 host target gene. NBR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NBR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBR2 BINDING SITE, designated SEQ ID:12424, to the nucleotide sequence of VGAM1009 RNA, herein designated VGAM RNA, also designated SEQ ID:3720.

[37323] Another function of VGAM1009 is therefore inhibition of NBR2 (Accession NM_005821). Accordingly, utilities of VGAM1009 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBR2. LOC149134 (Accession XM_097594) is another VGAM1009 host target gene. LOC149134 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC149134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149134 BINDING SITE, designated SEQ ID:40957, to the nucleotide sequence of VGAM1009 RNA, herein designated VGAM RNA, also designated SEQ ID:3720.

[37324] Another function of VGAM1009 is therefore inhibition of LOC149134 (Accession XM_097594). Accordingly, utilities of VGAM1009 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149134. LOC168283 (Accession XM_094966) is another VGAM1009 host target gene. LOC168283 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC168283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168283 BINDING SITE, designated SEQ ID:40239, to the nucleotide sequence of VGAM1009 RNA, herein designated VGAM RNA, also designated SEQ ID:3720.

[37325] Another function of VGAM1009 is therefore inhibition of LOC168283 (Accession XM_094966). Accordingly, utilities

of VGAM1009 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168283. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1010 (VGAM1010) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37326] VGAM1010 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1010 was detected is described hereinabove with reference to Figs. 1–8.

[37327] VGAM1010 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 4. VGAM1010 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37328] VGAM1010 gene encodes a VGAM1010 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1010 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu–

cleotide sequence of VGAM1010 precursor RNA is designated SEQ ID:996, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:996 is located at position 29765 relative to the genome of Equine Herpesvirus 4.

[37329] VGAM1010 precursor RNA folds onto itself, forming VGAM1010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37330] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1010 folded precursor RNA into VGAM1010 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1010 RNA is designated SEQ ID:3721, and

is provided hereinbelow with reference to the sequence listing part.

[37331] VGAM1010 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1010 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1010 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37332] VGAM1010 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1010 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1010 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1010 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1010 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37333] The complementary binding of VGAM1010 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1010 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1010 host target RNA into VGAM1010 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37334] It is appreciated that VGAM1010 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1010 host target genes. The mRNA of each one of this plurality of VGAM1010 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1010 RNA, herein designated VGAM RNA, and which when bound by VGAM1010 RNA causes inhibition of translation of respective one or more VGAM1010 host target proteins.

[37335] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1010 gene, herein designated VGAM GENE, on one or more VGAM1010 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37336] It is yet further appreciated that a function of VGAM1010 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1010 correlate with, and may be deduced from, the identity of the host target genes which VGAM1010 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37337] Nucleotide sequences of the VGAM1010 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1010 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1010 are further described hereinbelow with reference to Table 1.

[37338] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1010 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1010 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37339] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1010 gene, herein designated VGAM is inhibition of expression of VGAM1010 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1010 correlate with, and may be deduced from, the identity of the target genes which VGAM1010 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37340] Cytokine Inducible SH2-containing Protein (CISH, Accession NM_013324) is a VGAM1010 host target gene. CISH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CISH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CISH BINDING SITE, designated SEQ ID:14971, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37341] A function of VGAM1010 is therefore inhibition of Cytokine Inducible SH2-containing Protein (CISH, Accession NM_013324), a gene which intervenes in the negative regulation of cytokines. Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CISH. The function

of CISH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM488. Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM_012326) is another VGAM1010 host target gene. MAPRE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE3 BINDING SITE, designated SEQ ID:14713, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37342] Another function of VGAM1010 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM_012326), a gene which interact with cytoplasmic microtubules, and with the adenomatous polyposis coli. Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE3. The function of MAPRE3 and its association with various diseases and clinical conditions, has been established by previous stud-

ies, as described hereinabove with reference to VGAM340.DKFZp434O0320 (Accession XM_097012) is another VGAM1010 host target gene. DKFZp434O0320 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434O0320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434O0320 BINDING SITE, designated SEQ ID:40704, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37343] Another function of VGAM1010 is therefore inhibition of DKFZp434O0320 (Accession XM_097012). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434O0320. EPSIN (Accession NM_013333) is another VGAM1010 host target gene. EPSIN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EPSIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPSIN BIND-

ING SITE, designated SEQ ID:14980, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37344] Another function of VGAM1010 is therefore inhibition of EPSIN (Accession NM_013333). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPSIN. FASTK (Accession NM_025096) is another VGAM1010 host target gene. FASTK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FASTK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FASTK BINDING SITE, designated SEQ ID:24728, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37345] Another function of VGAM1010 is therefore inhibition of FASTK (Accession NM_025096). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FASTK. HSPC065 (Accession NM_014157) is another VGAM1010 host target gene. HSPC065 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by HSPC065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE, designated SEQ ID:15451, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37346] Another function of VGAM1010 is therefore inhibition of HSPC065 (Accession NM_014157). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065. MGC16025 (Accession NM_032923) is another VGAM1010 host target gene. MGC16025 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC16025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16025 BINDING SITE, designated SEQ ID:26748, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37347] Another function of VGAM1010 is therefore inhibition of

MGC16025 (Accession NM_032923). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16025. SEC8 (Accession NM_021807) is another VGAM1010 host target gene. SEC8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC8 BINDING SITE, designated SEQ ID:22360, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37348] Another function of VGAM1010 is therefore inhibition of SEC8 (Accession NM_021807). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC8. SYNE-2 (Accession NM_015180) is another VGAM1010 host target gene. SYNE-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNE-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of SYNE-2 BINDING SITE, designated SEQ ID:17532, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37349] Another function of VGAM1010 is therefore inhibition of SYNE-2 (Accession NM_015180). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNE-2. Transducer of ERBB2, 2 (TOB2, Accession XM_170995) is another VGAM1010 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45767, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37350] Another function of VGAM1010 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM_170995). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. LOC127435 (Accession

XM_072088) is another VGAM1010 host target gene.

LOC127435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127435 BINDING SITE, designated SEQ ID:37461, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37351] Another function of VGAM1010 is therefore inhibition of LOC127435 (Accession XM_072088). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127435. LOC157556 (Accession XM_098783) is another VGAM1010 host target gene. LOC157556 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157556 BINDING SITE, designated SEQ ID:41822, to the nucleotide sequence of VGAM1010 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3721.

[37352] Another function of VGAM1010 is therefore inhibition of LOC157556 (Accession XM_098783). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157556. LOC220143 (Accession XM_168046) is another VGAM1010 host target gene. LOC220143 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220143 BINDING SITE, designated SEQ ID:44952, to the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, also designated SEQ ID:3721.

[37353] Another function of VGAM1010 is therefore inhibition of LOC220143 (Accession XM_168046). Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220143. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1011 (VGAM1011) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37354] VGAM1011 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1011 was detected is described hereinabove with reference to Figs. 1–8.

[37355] VGAM1011 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 4. VGAM1011 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37356] VGAM1011 gene encodes a VGAM1011 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1011 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1011 precursor RNA is designated SEQ ID:997, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:997 is located at position 29460 relative to the genome of Equine Herpesvirus 4.

[37357] VGAM1011 precursor RNA folds onto itself, forming

VGAM1011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37358] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1011 folded precursor RNA into VGAM1011 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1011 RNA is designated SEQ ID:3722, and is provided hereinbelow with reference to the sequence listing part.

[37359] VGAM1011 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1011 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1011 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37360] VGAM1011 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1011 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1011 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1011 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1011 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37361] The complementary binding of VGAM1011 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1011 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1011 host target RNA into VGAM1011 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37362] It is appreciated that VGAM1011 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1011 host target genes. The mRNA of each one of this plurality of VGAM1011 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1011 RNA, herein designated VGAM RNA, and which when bound by VGAM1011 RNA causes inhibition of translation of respective one or more VGAM1011 host target proteins.

[37363] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1011 gene, herein designated VGAM GENE, on one or more VGAM1011 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37364] It is yet further appreciated that a function of VGAM1011 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1011 correlate with, and may be deduced from, the identity of the host target genes which VGAM1011 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[37365] Nucleotide sequences of the VGAM1011 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1011 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1011 are further described hereinbelow with reference to Table 1.

[37366] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1011 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1011 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37367] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1011 gene, herein designated VGAM is inhibition of expression of VGAM1011 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1011 correlate with, and may be deduced from, the identity of the target genes which VGAM1011 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[37368] Midline 1 (Opitz/BBB syndrome) (MID1, Accession NM_000381) is a VGAM1011 host target gene. MID1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MID1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MID1 BINDING SITE, designated SEQ ID:5954, to the nucleotide sequence of VGAM1011 RNA, herein designated VGAM RNA, also designated SEQ ID:3722.

[37369] A function of VGAM1011 is therefore inhibition of Midline 1 (Opitz/BBB syndrome) (MID1, Accession NM_000381). Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MID1. Mucin 3B (MUC3B, Accession XM_168578) is another VGAM1011 host target gene. MUC3B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MUC3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC3B BINDING SITE, designated SEQ

ID:45253, to the nucleotide sequence of VGAM1011 RNA, herein designated VGAM RNA, also designated SEQ ID:3722.

[37370] Another function of VGAM1011 is therefore inhibition of Mucin 3B (MUC3B, Accession XM_168578), a gene which provides a protective, lubricating barrier against particles and infectious agents at mucosal surfaces. Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC3B. The function of MUC3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.V-myc Myelocytomatosis Viral Oncogene Homolog 1, Lung Carcinoma Derived (avian) (MYCL1, Accession NM_005376) is another VGAM1011 host target gene. MYCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCL1 BINDING SITE, designated SEQ ID:11852, to the nucleotide sequence of VGAM1011 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3722.

[37371] Another function of VGAM1011 is therefore inhibition of V-myc Myelocytomatosis Viral Oncogene Homolog 1, Lung Carcinoma Derived (avian) (MYCL1, Accession NM_005376), a gene which is a Myc-like transcription factor. Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCL1. The function of MYCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM640. T-cell Leukemia/lymphoma 1A (TCL1A, Accession NM_021966) is another VGAM1011 host target gene. TCL1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCL1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL1A BINDING SITE, designated SEQ ID:22498, to the nucleotide sequence of VGAM1011 RNA, herein designated VGAM RNA, also designated SEQ ID:3722.

[37372] Another function of VGAM1011 is therefore inhibition of T-cell Leukemia/lymphoma 1A (TCL1A, Accession

NM_021966). Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL1A. Calpain 6 (CAPN6, Accession NM_014289) is another VGAM1011 host target gene. CAPN6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN6 BINDING SITE, designated SEQ ID:15569, to the nucleotide sequence of VGAM1011 RNA, herein designated VGAM RNA, also designated SEQ ID:3722.

[37373] Another function of VGAM1011 is therefore inhibition of Calpain 6 (CAPN6, Accession NM_014289). Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN6. FLJ11127 (Accession NM_019018) is another VGAM1011 host target gene. FLJ11127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of FLJ11127 BINDING SITE, designated SEQ ID:21108, to the nucleotide sequence of VGAM1011 RNA, herein designated VGAM RNA, also designated SEQ ID:3722.

[37374] Another function of VGAM1011 is therefore inhibition of FLJ11127 (Accession NM_019018). Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11127. KIAA1971 (Accession XM_058720) is another VGAM1011 host target gene. KIAA1971 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1971 BINDING SITE, designated SEQ ID:36726, to the nucleotide sequence of VGAM1011 RNA, herein designated VGAM RNA, also designated SEQ ID:3722.

[37375] Another function of VGAM1011 is therefore inhibition of KIAA1971 (Accession XM_058720). Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1971. LOC146756 (Accession XM_097085) is another

VGAM1011 host target gene. LOC146756 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146756 BINDING SITE, designated SEQ ID:40733, to the nucleotide sequence of VGAM1011 RNA, herein designated VGAM RNA, also designated SEQ ID:3722.

[37376] Another function of VGAM1011 is therefore inhibition of LOC146756 (Accession XM_097085). Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146756. LOC254015 (Accession XM_172977) is another VGAM1011 host target gene. LOC254015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254015 BINDING SITE, designated SEQ ID:46241, to the nucleotide sequence of VGAM1011 RNA, herein designated VGAM RNA, also designated SEQ ID:3722.

[37377] Another function of VGAM1011 is therefore inhibition of LOC254015 (Accession XM_172977). Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254015. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1012 (VGAM1012) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37378] VGAM1012 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1012 was detected is described hereinabove with reference to Figs. 1–8.

[37379] VGAM1012 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1012 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37380] VGAM1012 gene encodes a VGAM1012 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1012 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1012 precursor RNA is designated SEQ ID:998, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:998 is located at position 27830 relative to the genome of Equine Herpesvirus 1.

[37381] VGAM1012 precursor RNA folds onto itself, forming VGAM1012 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37382] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1012 folded precursor RNA into VGAM1012 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1012 RNA is designated SEQ ID:3723, and is provided hereinbelow with reference to the sequence listing part.

[37383] VGAM1012 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1012 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1012 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37384] VGAM1012 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1012 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1012 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1012 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1012 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37385] The complementary binding of VGAM1012 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1012 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1012 host target RNA into VGAM1012 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37386] It is appreciated that VGAM1012 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1012 host target genes. The mRNA of each one of this plurality of VGAM1012 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1012 RNA, herein designated VGAM RNA, and which when bound by VGAM1012 RNA causes inhibition of translation of respective one or more VGAM1012 host target proteins.

[37387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1012 gene, herein designated VGAM GENE, on one or more VGAM1012 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37388] It is yet further appreciated that a function of VGAM1012 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1012 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1012 correlate with, and may be deduced from, the identity of the host target genes which VGAM1012 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37389] Nucleotide sequences of the VGAM1012 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1012 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1012 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1012 are further described hereinbelow with reference to Table 1.

[37390] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1012 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1012 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[37391] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1012 gene, herein designated VGAM is inhibition of expression of VGAM1012 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1012 correlate with, and may be deduced from, the identity of the target genes which VGAM1012 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37392] Collagen, Type XVIII, Alpha 1 (COL18A1, Accession NM_030582) is a VGAM1012 host target gene. COL18A1 BINDING SITE1 through COL18A1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL18A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL18A1 BINDING SITE1 through COL18A1 BINDING SITE3, designated SEQ ID:24955, SEQ ID:28206 and SEQ ID:28207 respectively, to the nucleotide sequence of VGAM1012 RNA, herein designated VGAM RNA, also designated SEQ ID:3723.

[37393] A function of VGAM1012 is therefore inhibition of Colla-

gen, Type XVIII, Alpha 1 (COL18A1, Accession NM_030582). Accordingly, utilities of VGAM1012 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL18A1. EFS2 (Accession NM_005864) is another VGAM1012 host target gene. EFS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFS2 BINDING SITE, designated SEQ ID:12479, to the nucleotide sequence of VGAM1012 RNA, herein designated VGAM RNA, also designated SEQ ID:3723.

[37394] Another function of VGAM1012 is therefore inhibition of EFS2 (Accession NM_005864). Accordingly, utilities of VGAM1012 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFS2. FLJ21032 (Accession NM_024906) is another VGAM1012 host target gene. FLJ21032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ21032 BINDING SITE, designated SEQ ID:24402, to the nucleotide sequence of VGAM1012 RNA, herein designated VGAM RNA, also designated SEQ ID:3723.

[37395] Another function of VGAM1012 is therefore inhibition of FLJ21032 (Accession NM_024906). Accordingly, utilities of VGAM1012 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21032. FLJ23120 (Accession XM_097961) is another VGAM1012 host target gene. FLJ23120 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23120 BINDING SITE, designated SEQ ID:41266, to the nucleotide sequence of VGAM1012 RNA, herein designated VGAM RNA, also designated SEQ ID:3723.

[37396] Another function of VGAM1012 is therefore inhibition of FLJ23120 (Accession XM_097961). Accordingly, utilities of VGAM1012 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23120. KIAA0379 (Accession XM_042860) is another

VGAM1012 host target gene. KIAA0379 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0379, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0379 BINDING SITE, designated SEQ ID:33810, to the nucleotide sequence of VGAM1012 RNA, herein designated VGAM RNA, also designated SEQ ID:3723.

[37397] Another function of VGAM1012 is therefore inhibition of KIAA0379 (Accession XM_042860). Accordingly, utilities of VGAM1012 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0379. LAP1B (Accession XM_035429) is another VGAM1012 host target gene. LAP1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAP1B BINDING SITE, designated SEQ ID:32263, to the nucleotide sequence of VGAM1012 RNA, herein designated VGAM RNA, also designated SEQ ID:3723.

[37398] Another function of VGAM1012 is therefore inhibition of LAP1B (Accession XM_035429). Accordingly, utilities of VGAM1012 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAP1B. PBEF (Accession NM_005746) is another VGAM1012 host target gene. PBEF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PBEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PBEF BINDING SITE, designated SEQ ID:12307, to the nucleotide sequence of VGAM1012 RNA, herein designated VGAM RNA, also designated SEQ ID:3723.

[37399] Another function of VGAM1012 is therefore inhibition of PBEF (Accession NM_005746). Accordingly, utilities of VGAM1012 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PBEF. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1013 (VGAM1013) viral gene, which modulates expression of respective host target genes thereof, the function and

utility of which host target genes is known in the art.

[37400] VGAM1013 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1013 was detected is described hereinabove with reference to Figs. 1–8.

[37401] VGAM1013 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1013 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37402] VGAM1013 gene encodes a VGAM1013 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1013 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1013 precursor RNA is designated SEQ ID:999, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:999 is located at position 32583 relative to the genome of Equine Herpesvirus 1.

[37403] VGAM1013 precursor RNA folds onto itself, forming VGAM1013 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37404] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1013 folded precursor RNA into VGAM1013 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM1013 RNA is designated SEQ ID:3724, and is provided hereinbelow with reference to the sequence listing part.

[37405] VGAM1013 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1013 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1013 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[37406] VGAM1013 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1013 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1013 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1013 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1013 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[37407] The complementary binding of VGAM1013 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1013 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1013 host target RNA into VGAM1013 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37408] It is appreciated that VGAM1013 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1013 host target genes. The mRNA of each one of this plurality of VGAM1013 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1013 RNA, herein designated VGAM RNA, and which when bound by VGAM1013 RNA causes inhibition of translation of respective one or more VGAM1013 host target proteins.

[37409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1013 gene, herein designated VGAM GENE, on one

or more VGAM1013 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37410] It is yet further appreciated that a function of VGAM1013 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1013 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1013 correlate with, and may be deduced from, the identity of the host target genes which VGAM1013 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37411] Nucleotide sequences of the VGAM1013 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1013 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1013 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1013 are further described hereinbelow with reference to Table 1.

[37412] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1013 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1013 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37413] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1013 gene, herein designated VGAM is inhibition of expression of VGAM1013 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1013 correlate with, and may be deduced from, the identity of the target genes which VGAM1013 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37414] DKFZP434O047 (Accession NM_015594) is a VGAM1013

host target gene. DKFZP434O047 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434O047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:17859, to the nucleotide sequence of VGAM1013 RNA, herein designated VGAM RNA, also designated SEQ ID:3724.

[37415] A function of VGAM1013 is therefore inhibition of DKFZP434O047 (Accession NM_015594). Accordingly, utilities of VGAM1013 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047. FLJ32894 (Accession NM_144667) is another VGAM1013 host target gene. FLJ32894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32894 BINDING SITE, designated SEQ ID:29484, to the nucleotide sequence of VGAM1013 RNA, herein designated VGAM RNA, also designated SEQ ID:3724.

[37416] Another function of VGAM1013 is therefore inhibition of FLJ32894 (Accession NM_144667). Accordingly, utilities of VGAM1013 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32894. LOC151248 (Accession XM_087143) is another VGAM1013 host target gene. LOC151248 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151248 BINDING SITE, designated SEQ ID:39084, to the nucleotide sequence of VGAM1013 RNA, herein designated VGAM RNA, also designated SEQ ID:3724.

[37417] Another function of VGAM1013 is therefore inhibition of LOC151248 (Accession XM_087143). Accordingly, utilities of VGAM1013 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151248. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1014 (VGAM1014) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[37418] VGAM1014 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1014 was detected is described hereinabove with reference to Figs. 1–8.

[37419] VGAM1014 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1014 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37420] VGAM1014 gene encodes a VGAM1014 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1014 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1014 precursor RNA is designated SEQ ID:1000, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1000 is located at position 82653 relative to the genome of Rana Tigrina Ranavirus.

[37421] VGAM1014 precursor RNA folds onto itself, forming VGAM1014 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37422] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1014 folded precursor RNA into VGAM1014 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1014 RNA is designated SEQ ID:3725, and is provided hereinbelow with reference to the sequence listing part.

[37423] VGAM1014 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1014 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1014 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37424] VGAM1014 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1014 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1014 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1014 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1014 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37425] The complementary binding of VGAM1014 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1014 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1014 host target RNA into VGAM1014 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37426] It is appreciated that VGAM1014 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1014 host target genes. The mRNA of each one of this plurality of VGAM1014 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1014 RNA, herein designated VGAM RNA, and which when bound by VGAM1014 RNA causes inhibition of translation of respective one or more VGAM1014 host target proteins.

[37427] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1014 gene, herein designated VGAM GENE, on one or more VGAM1014 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37428] It is yet further appreciated that a function of VGAM1014 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1014 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1014 correlate with, and may be deduced from, the identity of the host target genes which VGAM1014 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[37429] Nucleotide sequences of the VGAM1014 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1014 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1014 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1014 are further described hereinbelow with reference to Table 1.

[37430] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1014 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1014 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37431] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1014 gene, herein designated VGAM is inhibition of expression of VGAM1014 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1014 correlate with, and may be deduced from, the identity of the target genes which VGAM1014 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37432] Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375) is a VGAM1014 host target gene.

C6orf37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ ID:33510, to the nucleotide sequence of VGAM1014 RNA, herein designated VGAM RNA, also designated SEQ ID:3725.

[37433] A function of VGAM1014 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375). Accordingly, utilities of VGAM1014 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. LOC196761 (Accession XM_116865) is another VGAM1014 host target gene. LOC196761 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196761 BINDING SITE, desig-

nated SEQ ID:43127, to the nucleotide sequence of VGAM1014 RNA, herein designated VGAM RNA, also designated SEQ ID:3725.

[37434] Another function of VGAM1014 is therefore inhibition of LOC196761 (Accession XM_116865). Accordingly, utilities of VGAM1014 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196761. LOC200609 (Accession XM_117256) is another VGAM1014 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43326, to the nucleotide sequence of VGAM1014 RNA, herein designated VGAM RNA, also designated SEQ ID:3725.

[37435] Another function of VGAM1014 is therefore inhibition of LOC200609 (Accession XM_117256). Accordingly, utilities of VGAM1014 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1015 (VGAM1015) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37436] VGAM1015 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1015 was detected is described hereinabove with reference to Figs. 1–8.

[37437] VGAM1015 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Broad Bean Necrosis Virus. VGAM1015 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37438] VGAM1015 gene encodes a VGAM1015 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1015 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1015 precursor RNA is designated SEQ ID:1001, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1001 is located at position 1200 relative to the

genome of Broad Bean Necrosis Virus.

[37439] VGAM1015 precursor RNA folds onto itself, forming VGAM1015 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37440] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1015 folded precursor RNA into VGAM1015 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1015 RNA is designated SEQ ID:3726, and is provided hereinbelow with reference to the sequence listing part.

[37441] VGAM1015 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1015 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1015 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[37442] VGAM1015 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1015 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1015 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1015 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1015 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37443] The complementary binding of VGAM1015 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1015 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1015 host target RNA into VGAM1015 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37444] It is appreciated that VGAM1015 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1015 host target genes. The mRNA of each one of this plurality of VGAM1015 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1015 RNA, herein designated VGAM RNA, and which when bound by VGAM1015 RNA causes inhibition of translation of respective one or more VGAM1015 host target proteins.

[37445] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1015 gene, herein designated VGAM GENE, on one or more VGAM1015 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37446] It is yet further appreciated that a function of VGAM1015 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1015 include diagnosis, prevention and treatment of viral infection by Broad Bean Necrosis Virus. Specific functions, and accordingly utilities, of VGAM1015

correlate with, and may be deduced from, the identity of the host target genes which VGAM1015 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37447] Nucleotide sequences of the VGAM1015 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1015 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1015 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1015 are further described hereinbelow with reference to Table 1.

[37448] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1015 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1015 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37449] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1015 gene, herein designated VGAM is inhibition of expression of VGAM1015 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1015 correlate with, and may be deduced

from, the identity of the target genes which VGAM1015 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37450] Endothelin 2 (EDN2, Accession NM_001956) is a VGAM1015 host target gene. EDN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDN2 BINDING SITE, designated SEQ ID:7680, to the nucleotide sequence of VGAM1015 RNA, herein designated VGAM RNA, also designated SEQ ID:3726.

[37451] A function of VGAM1015 is therefore inhibition of Endothelin 2 (EDN2, Accession NM_001956), a gene which is a precursor of the hormone endothelin 2 which is an endothelium-derived vasoconstrictor peptide. Accordingly, utilities of VGAM1015 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDN2. The function of EDN2 has been established by previous studies. The human endothelins represent a gene family comprised of endothelin-1 (OMIM Ref. No. 131240), endothelin-2, and endothelin-3 (OMIM Ref. No.

131242). Based on the deduced amino acid sequences of the cloned ET2 and ET3 genes, corresponding proteins have been chemically synthesized and their vasoconstrictor activities studied. Of the 3 isopeptides, ET-2 has the most potent vasoconstrictor activity. Ohkubo et al. (1990) cloned cDNAs encoding human ET-2 precursor from a cDNA library constructed with mRNA derived from the human renal adenocarcinoma cell line, ACHN, which specifically secretes immunoreactive ET-2. The cDNA was found to contain 1.3 kb and to encode the preproprotein consisting of 178 amino acid residues. Northern blot analysis of mRNA suggested that the transcript was 1.4 kb. Bloch et al. (1991) used a cDNA clone for endothelin-2 to map the EDN2 gene to 1pter-p21 in human-mouse somatic cell hybrids. Southern blot hybridization demonstrated a single gene in both the human and the rat genome. Bloch et al. (1991) cloned the rat gene; the rat peptide differed from the human peptide at only 1 of 21 residues and was identical to mouse vasoactive intestinal contractor peptide (VIC). They concluded, therefore, that VIC is the mouse and rat analog of the human EDN2 gene. By Southern blot analysis of somatic cell hybrid DNAs and by in situ hybridization, Arinami et al. (1991) confirmed the assign-

ment of EDN2 to chromosome 1 and regionalized it to 1p34. Deng et al. (1994) found in the rat that the endothelin-2 gene is located on chromosome 5 and cosegregates strongly with systolic blood pressure in an F2 population derived from a cross of the Dahl salt-sensitive rat and the Lewis rat. Thus, ET2 is a quantitative trait locus (QTL) for blood pressure in the rat. ET1, ET3, and endothelin receptor type A (ETA; 131243) in the rat did not cosegregate with blood pressure in the several F2 populations tested.

[37452] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37453] Bloch, K. D.; Hong, C. C.; Eddy, R. L.; Shows, T. B.; Quert-ermous, T. : cDNA cloning and chromosomal assignment of the endothelin 2 gene: vasoactive intestinal contractor peptide is rat endothelin 2. *Genomics* 10: 236-242, 1991. ; and

[37454] Deng, A. Y.; Dene, H.; Pravenec, M.; Rapp, J. P. : Genetic mapping of two new blood pressure quantitative trait loci in the rat by genotyping endothelin system genes. *J. Clin. Invest.* 93.

[37455] Further studies establishing the function and utilities of

EDN2 are found in John Hopkins OMIM database record ID 131241, and in cited publications numbered 12211–2289 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 20 (phosphate transporter), Member 2 (SLC20A2, Accession NM_006749) is another VGAM1015 host target gene. SLC20A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC20A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC20A2 BINDING SITE, designated SEQ ID:13602, to the nucleotide sequence of VGAM1015 RNA, herein designated VGAM RNA, also designated SEQ ID:3726.

[37456] Another function of VGAM1015 is therefore inhibition of Solute Carrier Family 20 (phosphate transporter), Member 2 (SLC20A2, Accession NM_006749), a gene which is a sodium–phosphate symporter. Accordingly, utilities of VGAM1015 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC20A2. The function of SLC20A2 and its association with various diseases and clinical conditions, has been es–

established by previous studies, as described hereinabove with reference to VGAM232.FLJ13231 (Accession NM_023073) is another VGAM1015 host target gene. FLJ13231 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13231 BINDING SITE, designated SEQ ID:23329, to the nucleotide sequence of VGAM1015 RNA, herein designated VGAM RNA, also designated SEQ ID:3726.

[37457] Another function of VGAM1015 is therefore inhibition of FLJ13231 (Accession NM_023073). Accordingly, utilities of VGAM1015 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13231. KIAA0981 (Accession XM_028867) is another VGAM1015 host target gene. KIAA0981 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0981 BINDING SITE, designated SEQ ID:30795, to the nucleotide sequence of VGAM1015 RNA, herein designated VGAM RNA, also designated SEQ ID:3726.

[37458] Another function of VGAM1015 is therefore inhibition of KIAA0981 (Accession XM_028867). Accordingly, utilities of VGAM1015 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0981. LOC148014 (Accession XM_085999) is another VGAM1015 host target gene. LOC148014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148014 BINDING SITE, designated SEQ ID:38441, to the nucleotide sequence of VGAM1015 RNA, herein designated VGAM RNA, also designated SEQ ID:3726.

[37459] Another function of VGAM1015 is therefore inhibition of LOC148014 (Accession XM_085999). Accordingly, utilities of VGAM1015 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148014. LOC152627 (Accession XM_087495) is another VGAM1015 host target gene. LOC152627 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152627 BINDING SITE, designated SEQ ID:39292, to the nucleotide sequence of VGAM1015 RNA, herein designated VGAM RNA, also designated SEQ ID:3726.

[37460] Another function of VGAM1015 is therefore inhibition of LOC152627 (Accession XM_087495). Accordingly, utilities of VGAM1015 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152627. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1016 (VGAM1016) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37461] VGAM1016 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1016 was detected is described hereinabove with reference to Figs. 1-8.

[37462] VGAM1016 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Broad Bean Necrosis Virus. VGAM1016 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37463] VGAM1016 gene encodes a VGAM1016 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1016 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1016 precursor RNA is designated SEQ ID:1002, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1002 is located at position 4420 relative to the genome of Broad Bean Necrosis Virus.

[37464] VGAM1016 precursor RNA folds onto itself, forming VGAM1016 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[37465] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1016 folded precursor RNA into VGAM1016 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1016 RNA is designated SEQ ID:3727, and is provided hereinbelow with reference to the sequence listing part.

[37466] VGAM1016 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1016 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1016 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37467] VGAM1016 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1016 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1016 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1016 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1016 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37468] The complementary binding of VGAM1016 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1016 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1016 host target RNA into VGAM1016 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37469] It is appreciated that VGAM1016 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1016 host target genes. The mRNA of each one of this plurality of VGAM1016 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1016 RNA, herein designated VGAM RNA, and which when bound by VGAM1016 RNA causes inhibition of translation of respective one or more VGAM1016 host target proteins.

[37470] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1016 gene, herein designated VGAM GENE, on one or more VGAM1016 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37471] It is yet further appreciated that a function of VGAM1016 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1016 include diagnosis, prevention and treatment of viral infection by Broad Bean Necrosis Virus. Specific functions, and accordingly utilities, of VGAM1016 correlate with, and may be deduced from, the identity of the host target genes which VGAM1016 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37472] Nucleotide sequences of the VGAM1016 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1016 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1016 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1016 are further described hereinbelow with reference to Table 1.

[37473] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1016 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1016 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37474] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1016 gene, herein designated VGAM is inhibition of expression of VGAM1016 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1016 correlate with, and may be deduced from, the identity of the target genes which VGAM1016 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37475] S-adenosylmethionine Decarboxylase 1 (AMD1, Accession NM_001634) is a VGAM1016 host target gene. AMD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of AMD1 BINDING SITE, designated SEQ ID:7348, to the nucleotide sequence of VGAM1016 RNA, herein designated VGAM RNA, also designated SEQ ID:3727.

[37476] A function of VGAM1016 is therefore inhibition of S-adenosylmethionine Decarboxylase 1 (AMD1, Accession NM_001634), a gene which catalyzes the removal of the carboxylate group of S-adenosylmethionine in the polyamine biosynthesis pathway. Accordingly, utilities of VGAM1016 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMD1. The function of AMD1 has been established by previous studies. The polyamines spermine, spermidine, and putrescine are low molecular weight aliphatic amines essential for cellular proliferation and tumor promotion. Ornithine decarboxylase (ODC; 165640) and S-adenosylmethionine decarboxylase (AdoMetDC) catalyze the rate-limiting steps in polyamine biosynthesis. A concordant rise in ODC and AdoMetDC activity is seen in various neoplastic conditions including colon cancer and benign colonic polyps. A rat cDNA clone for AdoMetDC was used by Radford et al. (1987, 1989) in mouse-human somatic cell hybrid experiments to map the AMD gene to

chromosomes 6 and X. They demonstrated that the gene on chromosome 6, symbolized AMD1, is not amplified in colon neoplasia. The sequence on X, symbolized AMD2, was localized to Xq22–q28 and may represent a pseudogene. That AMD2 is indeed a pseudogene was indicated by the findings of Maric et al. (1992) that the X-chromosome gene lacks introns which are present in the chromosome 6 gene. The gene on chromosome 6 encompasses at least 22 kb and comprises 9 exons and 8 introns, in contrast to the corresponding rat gene that has only 8 exons. Other aspects of the structure and organization were presented by Maric et al. (1992). Pulkka et al. (1993) characterized 2 AMD genes in the rat and localized both to rat chromosome 20 by mouse–rat somatic cell hybrids. They showed a high degree of conservation of sequence and structural organization in the coding portions but the 5–prime flanking regions were totally different. Maric et al. (1995) characterized the AMD pseudogene on the X chromosome. It lacks all the introns present in AMD1 and has numerous mutations in the protein–coding region. By fluorescence in situ hybridization, they mapped AMD1 to 6q21–q22 and the pseudogene, which they referred to as AMD2, to Xq28.

[37477] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37478] Maric, S. C.; Crozat, A.; Janne, O. A. : Structure and organization of the human S-adenosylmethionine decarboxylase gene. J. Biol. Chem. 267: 18915–18923, 1992. ; and

[37479] Maric, S. C.; Crozat, A.; Louhimo, J.; Knuutila, S.; Janne, O. A. : The human S-adenosylmethionine decarboxylase gene: nucleotide sequence of a pseudogene and chromosomal localization o.

[37480] Further studies establishing the function and utilities of AMD1 are found in John Hopkins OMIM database record ID 180980, and in cited publications numbered 11117–11118, 10267–1026 and 44 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphatidylinositol Transfer Protein, Beta (PITPNB, Accession NM_012399) is another VGAM1016 host target gene. PITPNB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PITPNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PITPNB BIND-

ING SITE, designated SEQ ID:14764, to the nucleotide sequence of VGAM1016 RNA, herein designated VGAM RNA, also designated SEQ ID:3727.

[37481] Another function of VGAM1016 is therefore inhibition of Phosphatidylinositol Transfer Protein, Beta (PITPNB, Accession NM_012399), a gene which catalyzes the transfer of ptdins and phosphatidylcholine between membranes. Accordingly, utilities of VGAM1016 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PITPNB. The function of PITPNB has been established by previous studies. Tanaka et al. (1995) cloned PITPNB cDNA by screening a human brain cDNA library with the rat brain cDNA homolog as probe. The deduced 271-amino acid protein has a calculated molecular mass of 31.5 kD and shows 98.1% sequence identity with the rat protein. Northern blot analysis detected ubiquitous expression of a 3.4-kb transcript, with highest expression in liver and lowest in skeletal muscle. Expression was found in all regions of the brain examined, with highest expression in amygdala. Phosphatidylinositol transfer protein is a member of a diverse set of cytosolic phospholipid transfer proteins that are distinguished by their ability to transfer phospholipids between membranes in vitro

(Wirtz, 1991).

[37482] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37483] Tanaka, S.; Yamashita, S.; Hosaka, K. : Cloning and expression of human cDNA encoding phosphatidylinositol transfer protein beta. *Biochim. Biophys. Acta* 1259: 199–202, 1995. ; and

[37484] Wirtz, K. W. A. : Phospholipid transfer proteins. *Annu. Rev. Biochem.* 60: 73–99, 1991.

[37485] Further studies establishing the function and utilities of PITPNB are found in John Hopkins OMIM database record ID 606876, and in cited publications numbered 608 and 8227 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM_006915) is another VGAM1016 host target gene. RP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP2 BINDING SITE, designated SEQ ID:13791, to the nu-

cleotide sequence of VGAM1016 RNA, herein designated VGAM RNA, also designated SEQ ID:3727.

[37486] Another function of VGAM1016 is therefore inhibition of Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM_006915). Accordingly, utilities of VGAM1016 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP2. Rho/rac Guanine Nucleotide Exchange Factor (GEF) 2 (ARHGEF2, Accession NM_004723) is another VGAM1016 host target gene. ARHGEF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF2 BINDING SITE, designated SEQ ID:11089, to the nucleotide sequence of VGAM1016 RNA, herein designated VGAM RNA, also designated SEQ ID:3727.

[37487] Another function of VGAM1016 is therefore inhibition of Rho/rac Guanine Nucleotide Exchange Factor (GEF) 2 (ARHGEF2, Accession NM_004723). Accordingly, utilities of VGAM1016 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

ARHGEF2. CCR4–NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_013354) is another VGAM1016 host target gene. CNOT7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNOT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT7 BINDING SITE, designated SEQ ID:14999, to the nucleotide sequence of VGAM1016 RNA, herein designated VGAM RNA, also designated SEQ ID:3727.

[37488] Another function of VGAM1016 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_013354). Accordingly, utilities of VGAM1016 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT7. LOC163341 (Accession XM_088817) is another VGAM1016 host target gene. LOC163341 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC163341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC163341 BINDING SITE, designated SEQ ID:39948, to the nucleotide sequence of VGAM1016 RNA, herein designated VGAM RNA, also designated SEQ ID:3727.

[37489] Another function of VGAM1016 is therefore inhibition of LOC163341 (Accession XM_088817). Accordingly, utilities of VGAM1016 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163341. LOC219920 (Accession XM_167787) is another VGAM1016 host target gene. LOC219920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44811, to the nucleotide sequence of VGAM1016 RNA, herein designated VGAM RNA, also designated SEQ ID:3727.

[37490] Another function of VGAM1016 is therefore inhibition of LOC219920 (Accession XM_167787). Accordingly, utilities of VGAM1016 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1017 (VGAM1017) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37491] VGAM1017 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1017 was detected is described hereinabove with reference to Figs. 1–8.

[37492] VGAM1017 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Western Yellows Virus. VGAM1017 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37493] VGAM1017 gene encodes a VGAM1017 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1017 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1017 precursor RNA is designated SEQ ID:1003, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1003 is located at position 4604 relative to the

genome of Beet Western Yellows Virus.

[37494] VGAM1017 precursor RNA folds onto itself, forming VGAM1017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37495] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1017 folded precursor RNA into VGAM1017 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1017 RNA is designated SEQ ID:3728, and is provided hereinbelow with reference to the sequence listing part.

[37496] VGAM1017 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1017 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1017 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[37497] VGAM1017 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1017 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1017 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1017 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1017 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[37498] The complementary binding of VGAM1017 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1017 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1017 host target RNA into VGAM1017 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37499] It is appreciated that VGAM1017 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1017 host target genes. The mRNA of each one of this plurality of VGAM1017 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1017 RNA, herein designated VGAM RNA, and which when bound by VGAM1017 RNA causes inhibition of translation of respective one or more VGAM1017 host target proteins.

[37500] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1017 gene, herein designated VGAM GENE, on one or more VGAM1017 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37501] It is yet further appreciated that a function of VGAM1017 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of viral infection by Beet Western Yellows Virus. Specific functions, and accordingly utilities, of VGAM1017

correlate with, and may be deduced from, the identity of the host target genes which VGAM1017 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37502] Nucleotide sequences of the VGAM1017 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1017 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1017 are further described hereinbelow with reference to Table 1.

[37503] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1017 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1017 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37504] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1017 gene, herein designated VGAM is inhibition of expression of VGAM1017 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1017 correlate with, and may be deduced

from, the identity of the target genes which VGAM1017 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37505] Kinesin Family Member 3B (KIF3B, Accession NM_004798) is a VGAM1017 host target gene. KIF3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF3B BINDING SITE, designated SEQ ID:11215, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37506] A function of VGAM1017 is therefore inhibition of Kinesin Family Member 3B (KIF3B, Accession NM_004798), a gene which is a microtubule-based anterograde translocator for membranous organelles. Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF3B. The function of KIF3B has been established by previous studies. In eukaryotic cells, proteins and lipids are sorted and transported to their correct destinations at distinct velocities by each organelle or protein complex. Kinesin

superfamily proteins are a molecular motor superfamily involved in these processes, conveying their own cargoes along microtubules. Nagase et al. (1997) cloned the KIF3B gene, which they referred to as KIAA0359, the human homolog of the mouse kinase superfamily 3B gene (Yamazaki et al., 1995). The human KIF3B gene encodes a 747-amino acid protein that shares 98% identity with the mouse Kif3b protein. RT-PCR analysis revealed that the KIF3B gene was ubiquitously expressed in all human tissues tested. By analysis of radiation hybrid panels, Nagase et al. (1997) mapped the KIF3B gene to chromosome 20. Animal model experiments lend further support to the function of KIF3B. By gene targeting, Nonaka et al. (1998) disrupted the murine Kif3b gene. The null mutants did not survive beyond midgestation, exhibiting growth retardation, pericardial sac ballooning, and neural tube disorganization. Prominently, the left-right asymmetry was randomized in the heart loop and the direction of embryonic turning. Lefty-2 (OMIM Ref. No. 603037) expression was either bilateral or absent. Furthermore, the node lacked monocilia while the basal bodies were present. Immunocytochemistry revealed Kif3b localization in wildtype nodal cilia. Video microscopy showed that these cilia were

motile and generated a leftward flow. These data suggested that KIF3B is essential for the left-right determination through intraciliary transportation of materials for ciliogenesis of motile primary cilia that could produce a gradient of putative morphogen along the left-right axis in the node

[37507] It is appreciated that the abovementioned animal model for KIF3B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[37508] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37509] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. VII. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 4: 141–150, 1997. ; and

[37510] Nonaka, S.; Tanaka, Y.; Okada, Y.; Takeda, S.; Harada, A.; Kanai, Y.; Kido, M.; Hirokawa, N. : Randomization of left-right asymmetry due to loss of nodal cilia generating leftward flow.

[37511] Further studies establishing the function and utilities of KIF3B are found in John Hopkins OMIM database record ID 603754, and in cited publications numbered 95 and 7600–7601 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lactate Dehydrogenase B (LDHB, Accession NM_002300) is another VGAM1017 host target gene. LDHB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LDHB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDHB BINDING SITE, designated SEQ ID:8086, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37512] Another function of VGAM1017 is therefore inhibition of Lactate Dehydrogenase B (LDHB, Accession NM_002300), a gene which causes dehydrogenation of lactate. Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDHB. The function of LDHB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM273.Neural Precursor Cell Expressed, Developmentally Down-regulated 4-like (NEDD4L, Accession NM_015277) is another VGAM1017 host target gene. NEDD4L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEDD4L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD4L BINDING SITE, designated SEQ ID:17605, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37513] Another function of VGAM1017 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 4-like (NEDD4L, Accession NM_015277), a gene which may play a role in the regulation of epithelial sodium channel function. Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD4L. The function of NEDD4L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM603.Protein Phosphatase 1, Regulatory

(inhibitor) Subunit 3C (PPP1R3C, Accession NM_005398) is another VGAM1017 host target gene. PPP1R3C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3C BINDING SITE, designated SEQ ID:11877, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37514] Another function of VGAM1017 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3C (PPP1R3C, Accession NM_005398). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3C. Regulatory Factor X-associated Protein (RFXAP, Accession NM_000538) is another VGAM1017 host target gene. RFXAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RFXAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFXAP BINDING SITE, designated SEQ

ID:6137, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37515] Another function of VGAM1017 is therefore inhibition of Regulatory Factor X-associated Protein (RFXAP, Accession NM_000538), a gene which binds to the x-box of mhc ii promoters and is a transcriptional regulator. Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFXAP. The function of RFXAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM797. Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083) is another VGAM1017 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22054, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37516] Another function of VGAM1017 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665) is another VGAM1017 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12206, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37517] Another function of VGAM1017 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5. IMAGE145052 (Accession NM_014267) is another VGAM1017 host target gene. IMAGE145052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA en-

coded by IMAGE145052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMAGE145052 BINDING SITE, designated SEQ ID:15542, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37518] Another function of VGAM1017 is therefore inhibition of IMAGE145052 (Accession NM_014267). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMAGE145052. KIAA0040 (Accession NM_014656) is another VGAM1017 host target gene. KIAA0040 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0040 BINDING SITE, designated SEQ ID:16093, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37519] Another function of VGAM1017 is therefore inhibition of KIAA0040 (Accession NM_014656). Accordingly, utilities

of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0040. KIAA0410 (Accession NM_014778) is another VGAM1017 host target gene. KIAA0410 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0410 BINDING SITE, designated SEQ ID:16613, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37520] Another function of VGAM1017 is therefore inhibition of KIAA0410 (Accession NM_014778). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0410. KIAA1579 (Accession NM_018211) is another VGAM1017 host target gene. KIAA1579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1579 BINDING SITE, designated SEQ ID:20117, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37521] Another function of VGAM1017 is therefore inhibition of KIAA1579 (Accession NM_018211). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1579. MGC10999 (Accession NM_032307) is another VGAM1017 host target gene. MGC10999 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10999, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10999 BINDING SITE, designated SEQ ID:26088, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37522] Another function of VGAM1017 is therefore inhibition of MGC10999 (Accession NM_032307). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10999. Nei Like 2 (E. coli) (NEIL2, Accession NM_145043) is another VGAM1017 host target gene.

NEIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEIL2 BINDING SITE, designated SEQ ID:29674, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37523] Another function of VGAM1017 is therefore inhibition of Nei Like 2 (E. coli) (NEIL2, Accession NM_145043). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEIL2. SSH2 (Accession XM_030846) is another VGAM1017 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31174, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37524] Another function of VGAM1017 is therefore inhibition of

SSH2 (Accession XM_030846). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. LOC126302 (Accession XM_059020) is another VGAM1017 host target gene. LOC126302 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126302 BINDING SITE, designated SEQ ID:36818, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37525] Another function of VGAM1017 is therefore inhibition of LOC126302 (Accession XM_059020). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126302. LOC145463 (Accession XM_048173) is another VGAM1017 host target gene. LOC145463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC145463 BINDING SITE, designated SEQ ID:35121, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37526] Another function of VGAM1017 is therefore inhibition of LOC145463 (Accession XM_048173). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145463. LOC255082 (Accession XM_172843) is another VGAM1017 host target gene. LOC255082 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255082 BINDING SITE, designated SEQ ID:46117, to the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, also designated SEQ ID:3728.

[37527] Another function of VGAM1017 is therefore inhibition of LOC255082 (Accession XM_172843). Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255082. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1018 (VGAM1018) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37528] VGAM1018 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1018 was detected is described hereinabove with reference to Figs. 1–8.

[37529] VGAM1018 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Western Yellows Virus. VGAM1018 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37530] VGAM1018 gene encodes a VGAM1018 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1018 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1018 precursor RNA is designated SEQ ID:1004, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1004 is located at position 3512 relative to the genome of Beet Western Yellows Virus.

[37531] VGAM1018 precursor RNA folds onto itself, forming VGAM1018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37532] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1018 folded precursor RNA into VGAM1018 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1018 RNA is designated SEQ ID:3729, and is provided hereinbelow with reference to the sequence listing part.

[37533] VGAM1018 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1018 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1018 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37534] VGAM1018 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1018 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1018 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1018 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1018 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[37535] The complementary binding of VGAM1018 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1018 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1018 host target RNA into VGAM1018 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37536] It is appreciated that VGAM1018 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1018 host target genes. The mRNA of each one of this plurality of VGAM1018 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1018 RNA, herein designated VGAM RNA, and which when bound by VGAM1018 RNA causes inhibition of translation of respective one or more

VGAM1018 host target proteins.

[37537] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1018 gene, herein designated VGAM GENE, on one or more VGAM1018 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37538] It is yet further appreciated that a function of VGAM1018 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1018 include diagnosis, prevention and treatment of viral infection by Beet Western Yellows Virus.

Specific functions, and accordingly utilities, of VGAM1018 correlate with, and may be deduced from, the identity of the host target genes which VGAM1018 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37539] Nucleotide sequences of the VGAM1018 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1018 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1018 are further described hereinbelow with reference to Table 1.

[37540] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1018 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1018 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37541] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1018 gene, herein designated VGAM is inhibition of expression of VGAM1018 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1018 correlate with, and may be deduced from, the identity of the target genes which VGAM1018 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37542] KIAA0556 (Accession XM_044632) is a VGAM1018 host target gene. KIAA0556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0556 BINDING SITE, designated SEQ ID:34247, to the nucleotide sequence of VGAM1018 RNA, herein designated VGAM RNA, also designated SEQ ID:3729.

[37543] A function of VGAM1018 is therefore inhibition of KIAA0556 (Accession XM_044632). Accordingly, utilities of VGAM1018 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0556. LOC256052 (Accession XM_174732) is another VGAM1018 host target gene. LOC256052 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256052, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256052 BINDING SITE, designated SEQ ID:46603, to the nucleotide sequence of VGAM1018 RNA, herein designated VGAM RNA, also designated SEQ ID:3729.

[37544] Another function of VGAM1018 is therefore inhibition of LOC256052 (Accession XM_174732). Accordingly, utilities of VGAM1018 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256052. LOC90139 (Accession NM_130783) is another VGAM1018 host target gene. LOC90139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90139 BINDING SITE, designated SEQ ID:28272, to the nucleotide sequence of VGAM1018 RNA, herein designated VGAM RNA, also designated SEQ ID:3729.

[37545] Another function of VGAM1018 is therefore inhibition of LOC90139 (Accession NM_130783). Accordingly, utilities of VGAM1018 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90139. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1019 (VGAM1019) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37546] VGAM1019 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1019 was detected is described hereinabove with reference to Figs. 1–8.

[37547] VGAM1019 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Western Yellows Virus. VGAM1019 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37548] VGAM1019 gene encodes a VGAM1019 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1019 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1019 precursor RNA is designated SEQ ID:1005, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1005 is located at position 5178 relative to the genome of Beet Western Yellows Virus.

- [37549] VGAM1019 precursor RNA folds onto itself, forming VGAM1019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [37550] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1019 folded precursor RNA into VGAM1019 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1019 RNA is designated SEQ ID:3730, and is provided hereinbelow with reference to the sequence listing part.

[37551] VGAM1019 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1019 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1019 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37552] VGAM1019 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1019 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1019 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1019 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1019 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37553] The complementary binding of VGAM1019 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1019 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1019 host target RNA into VGAM1019 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37554] It is appreciated that VGAM1019 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1019 host target genes. The mRNA of each one of this plurality of VGAM1019 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1019 RNA, herein designated VGAM RNA, and which when bound by VGAM1019 RNA causes

inhibition of translation of respective one or more VGAM1019 host target proteins.

[37555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1019 gene, herein designated VGAM GENE, on one or more VGAM1019 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37556] It is yet further appreciated that a function of VGAM1019 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1019 include diagnosis, prevention and

treatment of viral infection by Beet Western Yellows Virus. Specific functions, and accordingly utilities, of VGAM1019 correlate with, and may be deduced from, the identity of the host target genes which VGAM1019 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37557] Nucleotide sequences of the VGAM1019 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1019 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1019 are further described hereinbelow with reference to Table 1.

[37558] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1019 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1019 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37559] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1019 gene, herein designated VGAM is inhibition of expression of VGAM1019 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1019 correlate with, and may be deduced from, the identity of the target genes which VGAM1019 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37560] Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774) is a VGAM1019 host target gene. ANK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:30290, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37561] A function of VGAM1019 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. EphB6 (EPHB6, Accession NM_004445) is another VGAM1019 host target gene. EPHB6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EPHB6, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB6 BINDING SITE, designated SEQ ID:10740, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37562] Another function of VGAM1019 is therefore inhibition of EphB6 (EPHB6, Accession NM_004445), a gene which Putative Eph-related receptor tyrosine kinase B6. Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB6. The function of EPHB6 has been established by previous studies. See 179610 for background on Eph receptors and their ligands, the ephrins. By screening human brain and hematopoietic cell cDNA libraries with the catalytic domain of EPHB4 (OMIM Ref. No. 600011), Matsuoka et al. (1997) cloned a cDNA encoding EPHB6. The predicted 1,006-amino acid EPHB6 protein has the primary structural features of Eph-family receptor tyrosine kinases, but it lacks several invariant residues that have been shown to be essential for tyrosine kinase activity. Expression of the catalytic domain of EPHB6 in mammalian cells resulted in no detectable tyrosine kinase ac-

tivity in an in vitro assay. Northern blot analysis of normal human adult tissues showed that EPHB6 was expressed as a single 4.0-kb transcript in all tissues examined, with very strong expression in the brain and pancreas. EPHB6 is expressed in normal human brain as a 135-kD protein. By fluorescence in situ hybridization, Matsuoka et al. (1997) mapped the EPHB6 gene to 7q33–q35. Neuroblastoma (NB; 256700) is a common pediatric tumor that exhibits a wide range of biologic and clinical heterogeneity. EPH family receptor tyrosine kinases and ligand ephrins play pivotal roles in neural and cardiovascular development. High-level expression of transcripts encoding EPHB6 and its ligands ephrin-B2 (EFNB2; 600527) and ephrin-B3 (EFNB3; 602297) is associated with low-stage NB (stages 1, 2, and 4S) and high expression of TRKA (NTRK1; 191315). Tang et al. (2000) showed that EFNB2 and TRKA expressions were associated with both tumor stage and patient age, whereas EPHB6 and EFNB3 expressions were solely associated with tumor stage, suggesting that these genes were expressed in different subsets of NB. High-level expression of EPHB6, EFNB2, and EFNB3 predicted favorable NB outcome, and their expression combined with TRKA expression predicted the disease

outcome more accurately than each variable alone. If any 1 of the 4 genes was expressed at high levels in NB, the patient survival was excellent (more than 90%). Tang et al. (2000) found that transfection of EPHB6 cDNA into neuroblastoma cell lines expressing little endogenous EPHB6 resulted in inhibition of their clonogenicity in culture. Furthermore, transfection of EPHB6 suppressed the tumorigenicity of a cell line in a mouse xenograft model, demonstrating that high-level expressions of favorable NB genes, such as EPHB6, can in fact suppress malignant phenotype of unfavorable NB.

[37563] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37564] Matsuoka, H.; Iwata, N.; Ito, M.; Shimoyama, M.; Nagata, A.; Chihara, K.; Takai, S.; Matsui, T. : Expression of a kinase-defective Eph-like receptor in the normal human brain. *Biochem. Biophys. Res. Commun.* 235: 487-492, 1997. ; and

[37565] Tang, X. X.; Zhao, H.; Robinson, M. E.; Cohen, B.; Cnaan, A.; London, W.; Cohn, S. L.; Cheung, N.-K. V.; Brodeur, G. M.; Evans, A. E.; Ikegaki, N. : Implications of EPHB6, EFNB2, and EFN.

[37566] Further studies establishing the function and utilities of EPHB6 are found in John Hopkins OMIM database record ID 602757, and in cited publications numbered 5887–5888 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Erbb2 Interacting Protein (ERBB2IP, Accession NM_018695) is another VGAM1019 host target gene. ERBB2IP BINDING SITE1 and ERBB2IP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ERBB2IP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERBB2IP BINDING SITE1 and ERBB2IP BINDING SITE2, designated SEQ ID:20771 and SEQ ID:20772 respectively, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37567] Another function of VGAM1019 is therefore inhibition of Erbb2 Interacting Protein (ERBB2IP, Accession NM_018695), a gene which ERBB2 interacting protein; acts as an adaptor for the receptor ERBB2/HER2. Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ERBB2IP. The function of ERBB2IP has been established by previous studies. In a yeast 2-hybrid screen of a mouse kidney cDNA library with the 9 C-terminal residues of ErbB2 (OMIM Ref. No. 164870) as bait, Borg et al. (2000) cloned ErbB2ip, which they called Erbin. They cloned human ERBB2IP by RT-PCR of a human B-lymphocyte cell line. The deduced 1,371-amino acid protein contains 16 canonical LRR (leucine-rich repeat) motifs at the N terminus, followed by an LRR-like domain, proline-rich stretches that may represent binding sites for SH3 and WW domains, and a C-terminal PDZ domain. Northern blot analysis revealed a 7.2-kb transcript in most human and mouse tissues. Western blot analysis indicated a 180-kD doublet in all tissues tested. Favre et al. (2001) cloned ERBB2IP in a yeast 2-hybrid screen of a human keratinocyte cDNA library with the N terminus of bullous pemphigoid antigen-1 (BPAG1; 113810) as bait. They observed several splice variants. ERBB2IP was expressed as a doublet of about 6.9 to 7.4 kb in human keratinocytes and in a keratinocyte cell line. Semiquantitative RT-PCR indicated numerous transcripts expressed in most tissues. Western blot analysis showed a 200-kD in differentiated cells but not in undifferentiated keratinocytes.

Huang et al. (2001) cloned Erbb2ip from mouse muscle, brain, and heart cDNA libraries in a yeast 2-hybrid screen using Erbb2 as bait. Erbb2ip was expressed as a 180-kD protein in brain, skeletal muscle, primary muscle cultures, and muscle cell lines. Erbb2ip expression was found at a similar level in myoblasts and myotubes, suggesting that expression is not differentially regulated in muscle. By immunolocalization studies, they colocalized Erbb2ip with the acetylcholine receptor at the neuromuscular junction. Both Erbb2 and Erbb2ip were also found in synaptosomes from adult mouse brain and copurified with postsynaptic densities. The International Radiation Hybrid Mapping Consortium mapped the ERBB2IP gene to chromosome 5 (WI-31186). Favre et al. (2001) stated that sequence analysis places the ERBB2IP gene on the long arm of chromosome 5 between D5S427 and D5S647.

[37568] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37569] Favre, B.; Fontao, L.; Koster, J.; Shafaatian, R.; Jaunin, F.; Saurat, J.-H.; Sonnenberg, A.; Borradori, L. : The hemidesmosomal protein bullous pemphigoid antigen 1 and the integrin beta-4 subunit bind to ERBIN: molecular

cloning of multiple alternative splice variants of ERBIN and analysis of their tissue expression. J. Biol. Chem. 276: 32427–32436, 2001. ; and

[37570] Huang, Y. Z.; Wang, Q.; Xiong, W. C.; Mei, L. : Erbin is a protein concentrated at postsynaptic membranes that interacts with PSD-95. J. Biol. Chem. 276: 19318–19326, 2001.

[37571] Further studies establishing the function and utilities of ERBB2IP are found in John Hopkins OMIM database record ID 606944, and in cited publications numbered 527 and 5367 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 3 (GGA3, Accession NM_014001) is another VGAM1019 host target gene. GGA3 BINDING SITE1 and GGA3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA3 BINDING SITE1 and GGA3 BINDING SITE2, designated SEQ ID:15198 and SEQ ID:42262 respectively, to the nucleotide sequence of VGAM1019 RNA, herein designated

VGAM RNA, also designated SEQ ID:3730.

[37572] Another function of VGAM1019 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 3 (GGA3, Accession NM_014001), a gene which may play a role in the regulation of membrane traffic through the trans-golgi network. Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA3. The function of GGA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM353. BART1 (Accession NM_012106) is another VGAM1019 host target gene. BART1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BART1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BART1 BINDING SITE, designated SEQ ID:14424, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37573] Another function of VGAM1019 is therefore inhibition of BART1 (Accession NM_012106). Accordingly, utilities of

VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BART1. Chloride Intracellular Channel 4 (CLIC4, Accession NM_013943) is another VGAM1019 host target gene. CLIC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLIC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC4 BINDING SITE, designated SEQ ID:15130, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37574] Another function of VGAM1019 is therefore inhibition of Chloride Intracellular Channel 4 (CLIC4, Accession NM_013943). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC4. CMG2 (Accession NM_058172) is another VGAM1019 host target gene. CMG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CMG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of CMG2 BINDING SITE, designated SEQ ID:27721, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37575] Another function of VGAM1019 is therefore inhibition of CMG2 (Accession NM_058172). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMG2. DKFZp761K1423 (Accession NM_018422) is another VGAM1019 host target gene. DKFZp761K1423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:20472, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37576] Another function of VGAM1019 is therefore inhibition of DKFZp761K1423 (Accession NM_018422). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp761K1423. GAPCENA (Accession NM_012197) is another VGAM1019 host target gene. GAPCENA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GAPCENA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAPCENA BINDING SITE, designated SEQ ID:14493, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37577] Another function of VGAM1019 is therefore inhibition of GAPCENA (Accession NM_012197). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAPCENA. G Protein Pathway Suppressor 2 (GPS2, Accession XM_102749) is another VGAM1019 host target gene. GPS2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPS2 BINDING SITE, designated SEQ ID:42145, to the nucleotide sequence of VGAM1019 RNA, herein designated

VGAM RNA, also designated SEQ ID:3730.

[37578] Another function of VGAM1019 is therefore inhibition of G Protein Pathway Suppressor 2 (GPS2, Accession XM_102749). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPS2. HTEX4 (Accession XM_166378) is another VGAM1019 host target gene. HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HTEX4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3, designated SEQ ID:44216, SEQ ID:46652 and SEQ ID:46721 respectively, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37579] Another function of VGAM1019 is therefore inhibition of HTEX4 (Accession XM_166378). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTEX4. KIAA1887 (Accession XM_084801) is another VGAM1019 host target gene. KIAA1887 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by KIAA1887, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1887 BINDING SITE, designated SEQ ID:37716, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37580] Another function of VGAM1019 is therefore inhibition of KIAA1887 (Accession XM_084801). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1887. MGC13061 (Accession NM_032322) is another VGAM1019 host target gene. MGC13061 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13061 BINDING SITE, designated SEQ ID:26128, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37581] Another function of VGAM1019 is therefore inhibition of

MGC13061 (Accession NM_032322). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13061. Phospholipid Scramblase 2 (PLSCR2, Accession NM_020359) is another VGAM1019 host target gene. PLSCR2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLSCR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLSCR2 BINDING SITE, designated SEQ ID:21630, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37582] Another function of VGAM1019 is therefore inhibition of Phospholipid Scramblase 2 (PLSCR2, Accession NM_020359). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLSCR2. Suppression of Tumorigenicity 7 Like (ST7L, Accession NM_138727) is another VGAM1019 host target gene. ST7L BINDING SITE1 through ST7L BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

ST7L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7L BINDING SITE1 through ST7L BINDING SITE3, designated SEQ ID:28975, SEQ ID:29205 and SEQ ID:19333 respectively, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37583] Another function of VGAM1019 is therefore inhibition of Suppression of Tumorigenicity 7 Like (ST7L, Accession NM_138727). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L. Trinucleotide Repeat Containing 9 (TNRC9, Accession XM_049037) is another VGAM1019 host target gene. TNRC9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNRC9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNRC9 BINDING SITE, designated SEQ ID:35320, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37584] Another function of VGAM1019 is therefore inhibition of Trinucleotide Repeat Containing 9 (TNRC9, Accession XM_049037). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC9. LOC120534 (Accession XM_058476) is another VGAM1019 host target gene. LOC120534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120534 BINDING SITE, designated SEQ ID:36625, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37585] Another function of VGAM1019 is therefore inhibition of LOC120534 (Accession XM_058476). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120534. LOC147991 (Accession XM_085993) is another VGAM1019 host target gene. LOC147991 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147991, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147991 BINDING SITE, designated SEQ ID:38434, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37586] Another function of VGAM1019 is therefore inhibition of LOC147991 (Accession XM_085993). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147991. LOC149386 (Accession XM_097631) is another VGAM1019 host target gene. LOC149386 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149386 BINDING SITE, designated SEQ ID:40986, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37587] Another function of VGAM1019 is therefore inhibition of LOC149386 (Accession XM_097631). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149386. LOC150378 (Accession XM_086857) is another VGAM1019 host target gene. LOC150378 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150378 BINDING SITE, designated SEQ ID:38923, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37588] Another function of VGAM1019 is therefore inhibition of LOC150378 (Accession XM_086857). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150378. LOC151194 (Accession NM_145280) is another VGAM1019 host target gene. LOC151194 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151194 BINDING SITE, designated SEQ ID:29797, to

the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37589] Another function of VGAM1019 is therefore inhibition of LOC151194 (Accession NM_145280). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151194. LOC152402 (Accession XM_098222) is another VGAM1019 host target gene. LOC152402 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152402, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152402 BINDING SITE, designated SEQ ID:41495, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37590] Another function of VGAM1019 is therefore inhibition of LOC152402 (Accession XM_098222). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152402. LOC152633 (Accession XM_098248) is another VGAM1019 host target gene. LOC152633 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC152633, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152633 BINDING SITE, designated SEQ ID:41533, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37591] Another function of VGAM1019 is therefore inhibition of LOC152633 (Accession XM_098248). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152633. LOC201116 (Accession XM_113896) is another VGAM1019 host target gene. LOC201116 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201116 BINDING SITE, designated SEQ ID:42525, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37592] Another function of VGAM1019 is therefore inhibition of LOC201116 (Accession XM_113896). Accordingly, utilities

of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201116. LOC253142 (Accession XM_173229) is another VGAM1019 host target gene. LOC253142 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253142 BINDING SITE, designated SEQ ID:46501, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37593] Another function of VGAM1019 is therefore inhibition of LOC253142 (Accession XM_173229). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253142. LOC254065 (Accession XM_173239) is another VGAM1019 host target gene. LOC254065 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254065 BINDING SITE, designated SEQ ID:46520, to the nucleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, also designated SEQ ID:3730.

[37594] Another function of VGAM1019 is therefore inhibition of LOC254065 (Accession XM_173239). Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254065. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1020 (VGAM1020) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37595] VGAM1020 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1020 was detected is described hereinabove with reference to Figs. 1–8.

[37596] VGAM1020 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal Yellow Dwarf Virus – RPV. VGAM1020 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37597] VGAM1020 gene encodes a VGAM1020 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1020 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1020 precursor RNA is designated SEQ ID:1006, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1006 is located at position 3793 relative to the genome of Cereal Yellow Dwarf Virus – RPV.

[37598] VGAM1020 precursor RNA folds onto itself, forming VGAM1020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37599] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1020 folded precursor RNA into VGAM1020 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1020 RNA is designated SEQ ID:3731, and is provided hereinbelow with reference to the sequence listing part.

[37600] VGAM1020 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1020 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1020 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37601] VGAM1020 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1020 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1020 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1020 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1020 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[37602] The complementary binding of VGAM1020 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1020 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1020 host target RNA into VGAM1020 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37603] It is appreciated that VGAM1020 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1020 host target genes. The mRNA of each one of this plurality of VGAM1020 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1020 RNA, herein designated VGAM RNA, and which when bound by VGAM1020 RNA causes inhibition of translation of respective one or more VGAM1020 host target proteins.

[37604] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1020 gene, herein designated VGAM GENE, on one or more VGAM1020 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[37605] It is yet further appreciated that a function of VGAM1020 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of viral infection by Cereal Yellow Dwarf Virus – RPV. Specific functions, and accordingly utilities, of VGAM1020 correlate with, and may be deduced from, the identity of the host target genes which VGAM1020 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37606] Nucleotide sequences of the VGAM1020 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1020 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1020 are further described hereinbelow with reference to Table 1.

[37607] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1020 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1020 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37608] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1020 gene, herein designated VGAM is inhibition of expression of VGAM1020 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1020 correlate with, and may be deduced from, the identity of the target genes which VGAM1020 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37609] Acetylcholinesterase (YT blood group) (ACHE, Accession NM_015831) is a VGAM1020 host target gene. ACHE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACHE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACHE BINDING SITE, designated SEQ ID:17942, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37610] A function of VGAM1020 is therefore inhibition of Acetyl-

cholinesterase (YT blood group) (ACHE, Accession NM_015831), a gene which rapidly hydrolyzes choline released into the synapse. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACHE. The function of ACHE has been established by previous studies. Coates and Simpson (1972) concluded that 3 phenotypic variants of acetylcholinesterase (EC 3.1.1.7) result from 2 codominant alleles at a single locus. Rondino et al. (1988) showed that all the forms of acetylcholinesterase observed in avian nerves and muscle are encoded by a single autosomal gene. Differences in assembly and localization of the multiple synaptic forms of acetylcholinesterase are thought to arise through post-transcriptional events. Lapidot-Lifson et al. (1989) referred to the cloning of the gene for acetylcholinesterase. They used these clones to study the coamplification of acetylcholinesterase and pseudocholinesterase (butyrylcholinesterase; BCHE; 177400). Their coamplification in certain leukemias and in disorders of platelet formation suggest that the 2 loci may be linked. (The pseudocholinesterase gene is located at 3q25.2.) Whereas pseudocholinesterase is a soluble plasma enzyme pre-

sumed to be produced by the liver but also present in muscle and brain, acetylcholinesterase or 'true' cholinesterase is involved in the signal transmission at neuromuscular junctions and is also intensely expressed in the human central nervous system and the erythrocyte membrane. That such was the case was demonstrated by Getman et al. (1992). By chromosomal in situ suppression hybridization analysis, they showed that a single gene is located at 7q22 and confirmed the results by PCR analysis of genomic DNA from a human/hamster somatic cell hybrid containing a single human chromosome 7. Thus the gene maps to the same region that is frequently the site of nonrandom deletion in leukemias of myeloid cell precursors known to express acetylcholinesterase during normal differentiation. Animal model experiments lend further support to the function of ACHE. Feng et al. (1999) generated ColQ (OMIM Ref. No. 603033) –/– mice to study the roles played by ColQ and AChE in synapses and elsewhere.

[37611] It is appreciated that the abovementioned animal model for ACHE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

- [37612] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [37613] Lapidot–Lifson, Y.; Prody, C. A.; Ginzberg, D.; Meytes, D.; Zakut, H.; Soreq, H. : Coamplification of human acetylcholinesterase and butyrylcholinesterase genes in blood cells: correlation with various leukemias and abnormal megakaryocytopoiesis. Proc. Nat. Acad. Sci. 86: 4715–4719, 1989. ; and
- [37614] Feng, G.; Krejci, E.; Molgo, J.; Cunningham, J. M.; Massoulie, J.; Sanes, J. R. : Genetic analysis of collagen Q: roles in acetylcholinesterase and butyrylcholinesterase assembly and in.
- [37615] Further studies establishing the function and utilities of ACHE are found in John Hopkins OMIM database record ID 100740, and in cited publications numbered 4120–412 and 4224 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Adducin 1 (alpha) (ADD1, Accession NM_014190) is another VGAM1020 host target gene. ADD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD1 BINDING SITE, designated SEQ ID:15472, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37616] Another function of VGAM1020 is therefore inhibition of Adducin 1 (alpha) (ADD1, Accession NM_014190), a gene which membrane-cytoskeleton- protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD1. The function of ADD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM474.UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_006057) is another VGAM1020 host target gene. B3GALT5 BINDING SITE1 through B3GALT5 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GALT5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT5

BINDING SITE1 through B3GALT5 BINDING SITE5, designated SEQ ID:12697, SEQ ID:27021, SEQ ID:27025, SEQ ID:27030 and SEQ ID:27035 respectively, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37617] Another function of VGAM1020 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_006057). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT5. Cysteine-rich Motor Neuron 1 (CRIM1, Accession NM_016441) is another VGAM1020 host target gene. CRIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRIM1 BINDING SITE, designated SEQ ID:18560, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37618] Another function of VGAM1020 is therefore inhibition of Cysteine-rich Motor Neuron 1 (CRIM1, Accession

NM_016441). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRIM1. Epithelial Membrane Protein 1 (EMP1, Accession NM_001423) is another VGAM1020 host target gene. EMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMP1 BINDING SITE, designated SEQ ID:7133, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37619] Another function of VGAM1020 is therefore inhibition of Epithelial Membrane Protein 1 (EMP1, Accession NM_001423), a gene which plays a role in squamous cell differentiation; member of the PMP22/EMP/MP20 family of membrane glycoproteins. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMP1. The function of EMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM107.Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM_003950) is another VGAM1020 host target gene. F2RL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by F2RL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:10081, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37620] Another function of VGAM1020 is therefore inhibition of Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM_003950), a gene which Protease-activated receptor 4; G protein-coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3. The function of F2RL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193.Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_004961) is another

VGAM1020 host target gene. GABRE BINDING SITE1 through GABRE BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GABRE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABRE BINDING SITE1 through GABRE BINDING SITE4, designated SEQ ID:11408, SEQ ID:22510, SEQ ID:22514 and SEQ ID:22531 respectively, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37621] Another function of VGAM1020 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_004961), a gene which mediates neuronal inhibition by binding to the gaba/benzodiazepine receptor and opening an integral chloride channel. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRE. The function of GABRE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.Glutamate-ammonia Ligase (glutamine syn-

thase) (GLUL, Accession NM_002065) is another VGAM1020 host target gene. GLUL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLUL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLUL BINDING SITE, designated SEQ ID:7835, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37622] Another function of VGAM1020 is therefore inhibition of Glutamate-ammonia Ligase (glutamine synthase) (GLUL, Accession NM_002065), a gene which catalyzes the condensation of glutamate and ammonia to form glutamine. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLUL. The function of GLUL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM948. Hairless Homolog (mouse) (HR, Accession NM_005144) is another VGAM1020 host target gene. HR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by HR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HR BINDING SITE, designated SEQ ID:11617, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37623] Another function of VGAM1020 is therefore inhibition of Hairless Homolog (mouse) (HR, Accession NM_005144). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HR. Integrin, Alpha 3 (antigen CD49C, alpha 3 subunit of VLA-3 receptor) (ITGA3, Accession NM_005501) is another VGAM1020 host target gene. ITGA3 BINDING SITE1 and ITGA3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ITGA3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA3 BINDING SITE1 and ITGA3 BINDING SITE2, designated SEQ ID:12009 and SEQ ID:7966 respectively, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3731.

[37624] Another function of VGAM1020 is therefore inhibition of Integrin, Alpha 3 (antigen CD49C, alpha 3 subunit of VLA-3 receptor) (ITGA3, Accession NM_005501), a gene which is a receptor for fibronectin, laminin, collagen, epiligrin and thrombospondin. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA3. The function of ITGA3 has been established by previous studies. Integrins are a family of cell surface adhesion molecules. Each integrin consists of a pair of noncovalently associated alpha and beta chains. Integrin alpha-chain sequences are characterized by a 7-fold repeated amino acid motif, of which the last 3 or 4 contain divalent cation-binding sites. The ITGA3 subunit is associated with ITGB1 (OMIM Ref. No. 135630). By screening a bladder carcinoma cDNA library with a hamster galactoprotein B3 (Gapb3) probe, Tsuji et al. (1991) isolated cDNAs encoding ITGA3. The deduced 1,019-amino acid mature ITGA3 protein contains 14 potential N-glycosylation sites and a potential cleavage site. Northern blot analysis detected a 4.8-kb ITGA3 transcript whose expression was induced by SV-40 transformation. By immunoscreening an endothe-

lial cell cDNA library for ITGA3 protein, Takada et al. (1991) obtained an ITGA3 cDNA. Western blot analysis showed that recombinant ITGA3 was expressed as a 150-kD protein, the same size as the native protein. The deduced 1,051-amino acid ITGA3 protein has a 32-amino acid signal peptide, a 28-amino acid transmembrane domain, and a 32-amino acid cytoplasmic segment. ITGA3 also contains 13 potential N-glycosylation sites, 2 potential cleavage sites, and the 7 N-terminal repeating units characteristic of ITGAs. Northern blot analysis detected a 5-kb ITGA3 transcript in fibroblasts. Jones et al. (1998) determined that the ITGA3 gene spans 36.3 kb and contains 26 exons. By searching for sequences related to murine Itga3, Jones et al. (1998) identified a chromosome 17 clone corresponding to ITGA3. Human herpesvirus-8 (HHV-8) is implicated in the pathogenesis of Kaposi sarcoma. HHV-8 envelope glycoprotein B possesses the RGD amino acid motif known to interact with integrin molecules. Akula et al. (2002) found that HHV-8 infectivity was inhibited by RGD peptides, antibodies against the RGD-dependent integrins ITGA3 and ITGB1, and by soluble ITGA3/ITGB1. Expression of human ITGA3 increased the infectivity of virus for Chinese hamster ovary cells.

Anti-glycoprotein B antibodies immunoprecipitated the virus-ITGA3 and -ITGB1 complexes, and virus-binding studies suggested a role for ITGA3/ITGB1 in HHV-8 entry. Further, HHV-8 infection induced the integrin-mediated activation of focal adhesion kinase (FAK; 600758). These findings implicated a role for ITGA3/ITGB1 and the associated signaling pathways in HHV-8 entry into target cells.

[37625] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37626] Akula, S. M.; Pramod, N. P.; Wang, F.-Z.; Chandran, B. : Integrin alpha-3/beta-1 (CD 49c/29) is a cellular receptor for Kaposi's sarcoma-associated herpesvirus (KSHV/HHV-8) entry into the target cells. Cell 108: 407-419, 2002. ; and

[37627] Jones, S. D.; van der Flier, A.; Sonnenberg, A. : Genomic organization of the human alpha-3 integrin subunit gene. Biochem. Biophys. Res. Commun. 248: 896-898, 1998.

[37628] Further studies establishing the function and utilities of ITGA3 are found in John Hopkins OMIM database record ID 605025, and in cited publications numbered 334 and 4796-4798 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Microtubule-associated Protein 1B (MAP1B, Accession NM_005909) is another VGAM1020 host target gene. MAP1B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1B BINDING SITE, designated SEQ ID:12534, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37629] Another function of VGAM1020 is therefore inhibition of Microtubule-associated Protein 1B (MAP1B, Accession NM_005909), a gene which may have a role in neuronal plasticity and brain development. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1B. The function of MAP1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM316. RAD51-like 1 (*S. cerevisiae*) (RAD51L1, Accession NM_002877) is another VGAM1020 host target gene. RAD51L1 BINDING SITE1 and RAD51L1 BINDING

SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD51L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD51L1 BINDING SITE1 and RAD51L1 BINDING SITE2, designated SEQ ID:8786 and SEQ ID:28575 respectively, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37630] Another function of VGAM1020 is therefore inhibition of RAD51-like 1 (*S. cerevisiae*) (RAD51L1, Accession NM_002877), a gene which is a member of the RAD51 family of strand-transfer proteins. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD51L1. The function of RAD51L1 has been established by previous studies. The *E. coli* RecA protein plays a major role in recombination and repair. The *S. cerevisiae* RAD51 protein is homologous to RecA and functions in both mitotic and meiotic homologous recombination and in double-stranded break repair. See RAD51A (OMIM Ref. No. 179617). By computerized searching of an EST database, Albala et al. (1997) identified human and mouse cDNAs

encoding a protein with homology to RAD51. The predicted 350-amino acid human protein, designated RAD51B by them, shares 27 to 30% sequence identity with yeast and chicken RAD51 and human RAD51A. RAD51B contains conserved nucleotide-binding motifs, suggesting that it is an ATPase. Northern blot analysis revealed that RAD51B was expressed as a 1.8-kb mRNA in all tissues examined. In both mouse and human, the highest levels of expression were seen in testis, thymus, ovary, and spleen, tissues that undergo recombination events.

[37631] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37632] Albala, J. S.; Thelen, M. P.; Prange, C.; Fan, W.; Christensen, M.; Thompson, L. H.; Lennon, G. G. : Identification of a novel human RAD51 homolog, RAD51B. *Genomics* 46: 476-479, 1997. ; and

[37633] Masson, J.-Y.; Tarsounas, M. C.; Stasiak, A. Z.; Stasiak, A.; Shah, R.; McIlwraith, M. J.; Benson, F. E.; West, S. C. : Identification and purification of two distinct complexes containing.

[37634] Further studies establishing the function and utilities of RAD51L1 are found in John Hopkins OMIM database

record ID 602948, and in cited publications numbered 1056–1057, 2743–1603, 105 and 1692 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332) is another VGAM1020 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:28445, SEQ ID:28462 and SEQ ID:11347 respectively, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37635] Another function of VGAM1020 is therefore inhibition of Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152) is another VGAM1020 host target gene. C20orf12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf12 BINDING SITE, designated SEQ ID:19956, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37636] Another function of VGAM1020 is therefore inhibition of Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf12. CREB-H (Accession NM_032607) is another VGAM1020 host target gene. CREB-H BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CREB-H, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CREB-H BINDING SITE, designated SEQ ID:26330, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37637] Another function of VGAM1020 is therefore inhibition of CREB-H (Accession NM_032607). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREB-H. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 12 (CHL1-like helicase homolog, *S. cerevisiae*) (DDX12, Accession XM_006936) is another VGAM1020 host target gene. DDX12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX12 BINDING SITE, designated SEQ ID:30023, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37638] Another function of VGAM1020 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 12

(CHL1-like helicase homolog, *S. cerevisiae*) (DDX12, Accession XM_006936). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX12. DKFZp566H0824 (Accession NM_017535) is another VGAM1020 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated SEQ ID:18973, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37639] Another function of VGAM1020 is therefore inhibition of DKFZp566H0824 (Accession NM_017535). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824. FLJ11259 (Accession NM_018370) is another VGAM1020 host target gene. FLJ11259 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11259, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:20384, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37640] Another function of VGAM1020 is therefore inhibition of FLJ11259 (Accession NM_018370). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259. FLJ14327 (Accession NM_024912) is another VGAM1020 host target gene. FLJ14327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:24428, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37641] Another function of VGAM1020 is therefore inhibition of FLJ14327 (Accession NM_024912). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14327. Forkhead Box D4 (FOXD4, Accession XM_095746) is another VGAM1020 host target gene. FOXD4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXD4 BINDING SITE, designated SEQ ID:40282, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37642] Another function of VGAM1020 is therefore inhibition of Forkhead Box D4 (FOXD4, Accession XM_095746). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXD4. Integrin, Alpha 10 (ITGA10, Accession XM_002097) is another VGAM1020 host target gene. ITGA10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ITGA10 BINDING SITE, designated SEQ ID:29865, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37643] Another function of VGAM1020 is therefore inhibition of Integrin, Alpha 10 (ITGA10, Accession XM_002097). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA10. KIAA0544 (Accession XM_048119) is another VGAM1020 host target gene. KIAA0544 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0544 BINDING SITE, designated SEQ ID:35113, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37644] Another function of VGAM1020 is therefore inhibition of KIAA0544 (Accession XM_048119). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0544. KIAA0668 (Accession XM_039332) is another VGAM1020 host target gene. KIAA0668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0668 BINDING SITE, designated SEQ ID:33052, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37645] Another function of VGAM1020 is therefore inhibition of KIAA0668 (Accession XM_039332). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0668. KIAA0774 (Accession XM_166270) is another VGAM1020 host target gene. KIAA0774 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0774, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0774 BINDING SITE, designated SEQ ID:44091, to the nucleotide sequence of VGAM1020 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3731.

[37646] Another function of VGAM1020 is therefore inhibition of KIAA0774 (Accession XM_166270). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0774. KIAA0789 (Accession XM_033113) is another VGAM1020 host target gene. KIAA0789 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0789 BINDING SITE, designated SEQ ID:31848, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37647] Another function of VGAM1020 is therefore inhibition of KIAA0789 (Accession XM_033113). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0789. KIAA1855 (Accession XM_166453) is another VGAM1020 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1855, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44352, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37648] Another function of VGAM1020 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. MGC12538 (Accession NM_032746) is another VGAM1020 host target gene. MGC12538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12538 BINDING SITE, designated SEQ ID:26482, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37649] Another function of VGAM1020 is therefore inhibition of MGC12538 (Accession NM_032746). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC12538. MIC2 Like 1 (MIC2L1, Accession NM_031462) is another VGAM1020 host target gene. MIC2L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIC2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIC2L1 BINDING SITE, designated SEQ ID:25491, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37650] Another function of VGAM1020 is therefore inhibition of MIC2 Like 1 (MIC2L1, Accession NM_031462). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIC2L1. NFASC (Accession XM_046808) is another VGAM1020 host target gene. NFASC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NFASC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFASC BINDING SITE, designated SEQ ID:34832, to the nucleotide se-

quence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37651] Another function of VGAM1020 is therefore inhibition of NFASC (Accession XM_046808). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFASC. PEPP3 (Accession NM_014935) is another VGAM1020 host target gene. PEPP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEPP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEPP3 BINDING SITE, designated SEQ ID:17234, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37652] Another function of VGAM1020 is therefore inhibition of PEPP3 (Accession NM_014935). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEPP3. Sialyltransferase 4A (beta-galactoside alpha-2,3-sialyltransferase) (SIAT4A, Accession NM_003033) is another VGAM1020 host target gene. SIAT4A BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT4A BINDING SITE, designated SEQ ID:8981, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37653] Another function of VGAM1020 is therefore inhibition of Sialyltransferase 4A (beta-galactoside alpha-2,3-sialyltransferase) (SIAT4A, Accession NM_003033). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT4A. Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065) is another VGAM1020 host target gene. SIRPB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIRPB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:12708, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3731.

[37654] Another function of VGAM1020 is therefore inhibition of Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1. STRAIT11499 (Accession NM_021242) is another VGAM1020 host target gene. STRAIT11499 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STRAIT11499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRAIT11499 BINDING SITE, designated SEQ ID:22212, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37655] Another function of VGAM1020 is therefore inhibition of STRAIT11499 (Accession NM_021242). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRAIT11499. Zinc Finger Protein 339 (ZNF339, Accession NM_021220) is another VGAM1020 host target gene. ZNF339 BINDING SITE is HOST TARGET binding site

found in the 5' untranslated region of mRNA encoded by ZNF339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF339 BINDING SITE, designated SEQ ID:22199, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37656] Another function of VGAM1020 is therefore inhibition of Zinc Finger Protein 339 (ZNF339, Accession NM_021220). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF339. LOC129676 (Accession XM_065341) is another VGAM1020 host target gene. LOC129676 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129676 BINDING SITE, designated SEQ ID:37286, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37657] Another function of VGAM1020 is therefore inhibition of LOC129676 (Accession XM_065341). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129676. LOC132299 (Accession XM_059584) is another VGAM1020 host target gene. LOC132299 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC132299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132299 BINDING SITE, designated SEQ ID:37023, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37658] Another function of VGAM1020 is therefore inhibition of LOC132299 (Accession XM_059584). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132299. LOC143287 (Accession XM_096410) is another VGAM1020 host target gene. LOC143287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143287, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143287 BINDING SITE, designated SEQ ID:40345, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37659] Another function of VGAM1020 is therefore inhibition of LOC143287 (Accession XM_096410). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143287. LOC144110 (Accession XM_084735) is another VGAM1020 host target gene. LOC144110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144110 BINDING SITE, designated SEQ ID:37681, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37660] Another function of VGAM1020 is therefore inhibition of LOC144110 (Accession XM_084735). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC144110. LOC144373 (Accession XM_084841) is another VGAM1020 host target gene. LOC144373 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144373 BINDING SITE, designated SEQ ID:37728, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37661] Another function of VGAM1020 is therefore inhibition of LOC144373 (Accession XM_084841). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144373. LOC145622 (Accession XM_085186) is another VGAM1020 host target gene. LOC145622 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:37911, to the nucleotide sequence of VGAM1020 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3731.

[37662] Another function of VGAM1020 is therefore inhibition of LOC145622 (Accession XM_085186). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622. LOC146520 (Accession XM_085492) is another VGAM1020 host target gene. LOC146520 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146520 BINDING SITE, designated SEQ ID:38187, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37663] Another function of VGAM1020 is therefore inhibition of LOC146520 (Accession XM_085492). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146520. LOC146953 (Accession XM_085659) is another VGAM1020 host target gene. LOC146953 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146953, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146953 BINDING SITE, designated SEQ ID:38286, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37664] Another function of VGAM1020 is therefore inhibition of LOC146953 (Accession XM_085659). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146953. LOC152283 (Accession XM_098196) is another VGAM1020 host target gene. LOC152283 BINDING SITE1 and LOC152283 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC152283, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152283 BINDING SITE1 and LOC152283 BINDING SITE2, designated SEQ ID:41486 and SEQ ID:41487 respectively, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37665] Another function of VGAM1020 is therefore inhibition of

LOC152283 (Accession XM_098196). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152283. LOC155389 (Accession XM_088229) is another VGAM1020 host target gene. LOC155389 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC155389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155389 BINDING SITE, designated SEQ ID:39562, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37666] Another function of VGAM1020 is therefore inhibition of LOC155389 (Accession XM_088229). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155389. LOC221218 (Accession XM_166281) is another VGAM1020 host target gene. LOC221218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC221218 BINDING SITE, designated SEQ ID:44092, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37667] Another function of VGAM1020 is therefore inhibition of LOC221218 (Accession XM_166281). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221218. LOC253451 (Accession XM_171151) is another VGAM1020 host target gene. LOC253451 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253451 BINDING SITE, designated SEQ ID:45948, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37668] Another function of VGAM1020 is therefore inhibition of LOC253451 (Accession XM_171151). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253451. LOC256974 (Accession XM_173190) is an-

other VGAM1020 host target gene. LOC256974 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256974, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256974 BINDING SITE, designated SEQ ID:46436, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37669] Another function of VGAM1020 is therefore inhibition of LOC256974 (Accession XM_173190). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256974. LOC90495 (Accession XM_032166) is another VGAM1020 host target gene. LOC90495 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90495 BINDING SITE, designated SEQ ID:31579, to the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, also designated SEQ ID:3731.

[37670] Another function of VGAM1020 is therefore inhibition of LOC90495 (Accession XM_032166). Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90495. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1021 (VGAM1021) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37671] VGAM1021 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1021 was detected is described hereinabove with reference to Figs. 1–8.

[37672] VGAM1021 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal Yellow Dwarf Virus – RPV. VGAM1021 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37673] VGAM1021 gene encodes a VGAM1021 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1021 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1021 precursor RNA is designated SEQ ID:1007, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1007 is located at position 2132 relative to the genome of Cereal Yellow Dwarf Virus – RPV.

- [37674] VGAM1021 precursor RNA folds onto itself, forming VGAM1021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [37675] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1021 folded precursor RNA into VGAM1021 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1021 RNA is designated SEQ ID:3732, and is provided hereinbelow with reference to the sequence listing part.

[37676] VGAM1021 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1021 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1021 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[37677] VGAM1021 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1021 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1021 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1021 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1021 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37678] The complementary binding of VGAM1021 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1021 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1021 host target RNA into VGAM1021 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37679] It is appreciated that VGAM1021 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1021 host target genes. The mRNA of each one of this plurality of VGAM1021 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1021 RNA, herein designated VGAM RNA, and which when bound by VGAM1021 RNA causes inhibition of translation of respective one or more VGAM1021 host target proteins.

[37680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1021 gene, herein designated VGAM GENE, on one or more VGAM1021 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37681] It is yet further appreciated that a function of VGAM1021 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1021 include diagnosis, prevention and treatment of viral infection by Cereal Yellow Dwarf Virus – RPV. Specific functions, and accordingly utilities, of VGAM1021 correlate with, and may be deduced from, the identity of the host target genes which VGAM1021 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37682] Nucleotide sequences of the VGAM1021 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1021 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1021 are further described hereinbelow with reference to Table 1.

[37683] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM1021 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1021 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[37684] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1021 gene, herein designated VGAM is inhibition of expression of VGAM1021 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1021 correlate with, and may be deduced from, the identity of the target genes which VGAM1021 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37685] Centrosomal Protein 2 (CEP2, Accession NM_006779) is a VGAM1021 host target gene. CEP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP2 BINDING SITE, designated SEQ ID:13652, to the nucleotide sequence of VGAM1021 RNA, herein designated VGAM RNA, also designated SEQ ID:3732.

[37686] A function of VGAM1021 is therefore inhibition of Centrosomal Protein 2 (CEP2, Accession NM_006779), a gene which interacts with TC10 and CDC42. Accordingly, utilities of VGAM1021 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CEP2. The function of CEP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329. Dystrobrevin, Alpha (DTNA, Accession NM_001391) is another VGAM1021 host target gene. DTNA BINDING SITE1 through DTNA BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DTNA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTNA BINDING SITE1 through DTNA BINDING SITE4, designated SEQ ID:7080, SEQ ID:26838, SEQ ID:26843 and SEQ ID:26848 respectively, to the nucleotide sequence of VGAM1021 RNA, herein designated VGAM RNA, also designated SEQ ID:3732.

[37687] Another function of VGAM1021 is therefore inhibition of Dystrobrevin, Alpha (DTNA, Accession NM_001391), a gene which may be involved in the formation and stability of synapses. Accordingly, utilities of VGAM1021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTNA. The function of

DTNA has been established by previous studies. The dystrophin-associated protein complex (DPC), located at the sarcolemma, can be divided into 3 subcomplexes: the dystroglycan complex, the sarcoglycan complex, and the cytoplasmic complex. The last consists of 2 families of proteins, the syntrophins and dystrobrevin. Metzinger et al. (1997) found that anti-dystrobrevin antibodies stain the sarcolemma in normal skeletal muscle, indicating that dystrobrevin colocalizes with dystrophin and the dystrophin-associated protein complex. By contrast, dystrobrevin membrane staining was severely reduced in muscles of Duchenne muscular dystrophy patients and also dramatically reduced in patients with limb-girdle muscular dystrophy arising from the loss of 1 or all of the sarcoglycan components (e.g., LGMD2C; 253700). Normal dystrobrevin staining was observed in patients with other forms of limb-girdle muscular dystrophy where dystrophin and the rest of the dystrophin-associated protein complex are normally expressed (e.g., LGMD2A; 253600), as well as in other neuromuscular disorders. Their results showed that dystrobrevin deficiency is a generic feature of dystrophies linked to dystrophin and the dystrophin-associated proteins. This was the first indication that a cyto-

plasmic component of the dystrophin-associated protein complex may be involved in the pathogenesis of limb-girdle muscular dystrophy. Left ventricular noncompaction (LVNC) is due to an arrest of myocardial morphogenesis. The disorder is characterized by a hypertrophic left ventricular with deep trabeculations and with poor systolic function, with or without associated left ventricular dilation. In some cases, the right ventricle is also affected. LVNC may be isolated (see OMIM Ref. No. 300183 and 604169) or associated with congenital heart anomalies such as ventricular septal defects, pulmonic stenosis, and atrial septal defects. Ichida et al. (2001) screened the DTNA gene in a Japanese family in which members of 4 generations were affected, 5 with LVNC associated with congenital heart defects (OMIM Ref. No. 606617) and 1 with isolated LVNC. They found a missense mutation in the DTNA gene, P121L (601239.0001).

[37688] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37689] Ichida, F.; Tsubata, S.; Bowles, K. R.; Haneda, N.; Uese, K.; Miyawaki, T.; Dreyer, W. J.; Messina, J.; Li, H.; Bowles, N. E.; Towbin, J. A. : Novel gene mutations in patients with

left ventricular noncompaction or Barth syndrome. Circulation 103: 1256–1263, 2001. ; and

[37690] Metzinger, L.; Blake, D. J.; Squier, M. V.; Anderson, L. V. B.; Deconinck, A. E.; Nawrotzki, R.; Hilton–Jones, D.; Davies, K. E. : Dystrobrevin deficiency at the sarcolemma of patients.

[37691] Further studies establishing the function and utilities of DTNA are found in John Hopkins OMIM database record ID 601239, and in cited publications numbered 2841–2843, 751 and 7517–7520 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 6 Open Reading Frame 33 (C6orf33, Accession NM_133367) is another VGAM1021 host target gene. C6orf33 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6orf33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf33 BINDING SITE, designated SEQ ID:28493, to the nucleotide sequence of VGAM1021 RNA, herein designated VGAM RNA, also designated SEQ ID:3732.

[37692] Another function of VGAM1021 is therefore inhibition of

Chromosome 6 Open Reading Frame 33 (C6orf33, Accession NM_133367). Accordingly, utilities of VGAM1021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf33. KIAA0089 (Accession XM_046056) is another VGAM1021 host target gene. KIAA0089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:34667, to the nucleotide sequence of VGAM1021 RNA, herein designated VGAM RNA, also designated SEQ ID:3732.

[37693] Another function of VGAM1021 is therefore inhibition of KIAA0089 (Accession XM_046056). Accordingly, utilities of VGAM1021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0089. Phosphatidylserine Decarboxylase (PISD, Accession NM_014338) is another VGAM1021 host target gene. PISD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PISD, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PISD BINDING SITE, designated SEQ ID:15657, to the nucleotide sequence of VGAM1021 RNA, herein designated VGAM RNA, also designated SEQ ID:3732.

[37694] Another function of VGAM1021 is therefore inhibition of Phosphatidylserine Decarboxylase (PISD, Accession NM_014338). Accordingly, utilities of VGAM1021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PISD. PNAS-127 (Accession NM_032490) is another VGAM1021 host target gene. PNAS-127 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PNAS-127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNAS-127 BINDING SITE, designated SEQ ID:26241, to the nucleotide sequence of VGAM1021 RNA, herein designated VGAM RNA, also designated SEQ ID:3732.

[37695] Another function of VGAM1021 is therefore inhibition of PNAS-127 (Accession NM_032490). Accordingly, utilities of VGAM1021 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with PNAS-127. Williams Beuren Syndrome Chromosome Region 21 (WBSCR21, Accession NM_031295) is another VGAM1021 host target gene. WBSCR21 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WBSCR21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR21 BINDING SITE, designated SEQ ID:25326, to the nucleotide sequence of VGAM1021 RNA, herein designated VGAM RNA, also designated SEQ ID:3732.

[37696] Another function of VGAM1021 is therefore inhibition of Williams Beuren Syndrome Chromosome Region 21 (WBSCR21, Accession NM_031295). Accordingly, utilities of VGAM1021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR21. LOC149721 (Accession XM_086649) is another VGAM1021 host target gene. LOC149721 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC149721 BINDING SITE, designated SEQ ID:38809, to the nucleotide sequence of VGAM1021 RNA, herein designated VGAM RNA, also designated SEQ ID:3732.

[37697] Another function of VGAM1021 is therefore inhibition of LOC149721 (Accession XM_086649). Accordingly, utilities of VGAM1021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149721. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1022 (VGAM1022) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37698] VGAM1022 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1022 was detected is described hereinabove with reference to Figs. 1–8.

[37699] VGAM1022 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal Yellow Dwarf Virus – RPV. VGAM1022 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[37700] VGAM1022 gene encodes a VGAM1022 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1022 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1022 precursor RNA is designated SEQ ID:1008, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1008 is located at position 2327 relative to the genome of Cereal Yellow Dwarf Virus – RPV.

[37701] VGAM1022 precursor RNA folds onto itself, forming VGAM1022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37702] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1022 folded precursor RNA into VGAM1022 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1022 RNA is designated SEQ ID:3733, and is provided hereinbelow with reference to the sequence listing part.

[37703] VGAM1022 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1022 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1022 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37704] VGAM1022 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1022 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1022 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1022 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1022 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37705] The complementary binding of VGAM1022 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1022 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1022 host target RNA into VGAM1022 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37706] It is appreciated that VGAM1022 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1022 host target genes. The mRNA of each one of this plurality of VGAM1022 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1022 RNA, herein designated VGAM RNA, and which when bound by VGAM1022 RNA causes inhibition of translation of respective one or more VGAM1022 host target proteins.

[37707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1022 gene, herein designated VGAM GENE, on one or more VGAM1022 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37708] It is yet further appreciated that a function of VGAM1022 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1022 include diagnosis, prevention and treatment of viral infection by Cereal Yellow Dwarf Virus – RPV. Specific functions, and accordingly utilities, of VGAM1022 correlate with, and may be deduced from, the identity of the host target genes which VGAM1022 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37709] Nucleotide sequences of the VGAM1022 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1022 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1022 are further described hereinbelow with reference to Table 1.

[37710] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of

Fig. 1, found on VGAM1022 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1022 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37711] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1022 gene, herein designated VGAM is inhibition of expression of VGAM1022 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1022 correlate with, and may be deduced from, the identity of the target genes which VGAM1022 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37712] Calsequestrin 2 (cardiac muscle) (CASQ2, Accession NM_001232) is a VGAM1022 host target gene. CASQ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CASQ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASQ2 BINDING SITE, designated SEQ ID:6902, to the nucleotide sequence of VGAM1022 RNA, herein designated VGAM RNA, also designated SEQ ID:3733.

[37713] A function of VGAM1022 is therefore inhibition of Calsequestrin 2 (cardiac muscle) (CASQ2, Accession NM_001232). Accordingly, utilities of VGAM1022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASQ2. RAP1A, Member of RAS Oncogene Family (RAP1A, Accession NM_002884) is another VGAM1022 host target gene. RAP1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP1A BINDING SITE, designated SEQ ID:8792, to the nucleotide sequence of VGAM1022 RNA, herein designated VGAM RNA, also designated SEQ ID:3733.

[37714] Another function of VGAM1022 is therefore inhibition of RAP1A, Member of RAS Oncogene Family (RAP1A, Accession NM_002884), a gene which induces morphological reversion of a cell line transformed by a ras oncogene. Accordingly, utilities of VGAM1022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1A. The function of RAP1A and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM993.DKFZp547I094 (Accession NM_032155) is another VGAM1022 host target gene. DKFZp547I094 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547I094, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I094 BINDING SITE, designated SEQ ID:25855, to the nucleotide sequence of VGAM1022 RNA, herein designated VGAM RNA, also designated SEQ ID:3733.

[37715] Another function of VGAM1022 is therefore inhibition of DKFZp547I094 (Accession NM_032155). Accordingly, utilities of VGAM1022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I094. MGC11082 (Accession NM_032691) is another VGAM1022 host target gene. MGC11082 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC11082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of MGC11082 BINDING SITE, designated SEQ ID:26411, to the nucleotide sequence of VGAM1022 RNA, herein designated VGAM RNA, also designated SEQ ID:3733.

[37716] Another function of VGAM1022 is therefore inhibition of MGC11082 (Accession NM_032691). Accordingly, utilities of VGAM1022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11082. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1023 (VGAM1023) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37717] VGAM1023 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1023 was detected is described hereinabove with reference to Figs. 1–8.

[37718] VGAM1023 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal Yellow Dwarf Virus – RPV. VGAM1023 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[37719] VGAM1023 gene encodes a VGAM1023 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1023 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1023 precursor RNA is designated SEQ ID:1009, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1009 is located at position 3936 relative to the genome of Cereal Yellow Dwarf Virus – RPV.

[37720] VGAM1023 precursor RNA folds onto itself, forming VGAM1023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37721] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1023 folded precursor RNA into VGAM1023 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1023 RNA is designated SEQ ID:3734, and is provided hereinbelow with reference to the sequence listing part.

[37722] VGAM1023 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1023 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1023 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37723] VGAM1023 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1023 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1023 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1023 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1023 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37724] The complementary binding of VGAM1023 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1023 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1023 host target RNA into VGAM1023 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37725] It is appreciated that VGAM1023 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1023 host target genes. The mRNA of each one of this plurality of VGAM1023 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1023 RNA, herein designated VGAM RNA, and which when bound by VGAM1023 RNA causes inhibition of translation of respective one or more VGAM1023 host target proteins.

[37726] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1023 gene, herein designated VGAM GENE, on one or more VGAM1023 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[37727] It is yet further appreciated that a function of VGAM1023 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of viral infection by Cereal Yellow Dwarf Virus – RPV. Specific functions, and accordingly utilities, of VGAM1023 correlate with, and may be deduced from, the identity of the host target genes which VGAM1023 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37728] Nucleotide sequences of the VGAM1023 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1023 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1023 are further described hereinbelow with reference to Table 1.

[37729] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM1023 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1023 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37730] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1023 gene, herein designated VGAM is inhibition of expression of VGAM1023 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1023 correlate with, and may be deduced from, the identity of the target genes which VGAM1023 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37731] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession NM_144767) is a VGAM1023 host target gene. AKAP13 BINDING SITE1 through AKAP13 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AKAP13, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE1 through AKAP13 BINDING SITE3, designated SEQ ID:29558, SEQ ID:13589 and SEQ ID:14054 respectively, to the nucleotide sequence of VGAM1023 RNA, herein

designated VGAM RNA, also designated SEQ ID:3734.

[37732] A function of VGAM1023 is therefore inhibition of A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession NM_144767), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM17. Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM_031364) is another VGAM1023 host target gene. COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3, designated SEQ ID:25357, SEQ ID:5544 and SEQ ID:19255 respectively, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37733] Another function of VGAM1023 is therefore inhibition of Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM_031364). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A3. Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM_029962) is another VGAM1023 host target gene. KCNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNT1 BINDING SITE, designated SEQ ID:30970, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37734] Another function of VGAM1023 is therefore inhibition of Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM_029962). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNT1. KIAA0522 (Accession XM_050404) is another VGAM1023 host target gene. KIAA0522 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by KIAA0522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0522 BINDING SITE, designated SEQ ID:35621, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37735] Another function of VGAM1023 is therefore inhibition of KIAA0522 (Accession XM_050404). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0522. LOC145717 (Accession XM_039771) is another VGAM1023 host target gene. LOC145717 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145717 BINDING SITE, designated SEQ ID:33187, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37736] Another function of VGAM1023 is therefore inhibition of

LOC145717 (Accession XM_039771). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145717. LOC152925 (Accession XM_087559) is another VGAM1023 host target gene. LOC152925 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152925 BINDING SITE, designated SEQ ID:39333, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37737] Another function of VGAM1023 is therefore inhibition of LOC152925 (Accession XM_087559). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152925. LOC158301 (Accession XM_088543) is another VGAM1023 host target gene. LOC158301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC158301 BINDING SITE, designated SEQ ID:39808, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37738] Another function of VGAM1023 is therefore inhibition of LOC158301 (Accession XM_088543). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158301. LOC196957 (Accession XM_113789) is another VGAM1023 host target gene. LOC196957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196957 BINDING SITE, designated SEQ ID:42425, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37739] Another function of VGAM1023 is therefore inhibition of LOC196957 (Accession XM_113789). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196957. LOC196961 (Accession XM_113790) is an-

other VGAM1023 host target gene. LOC196961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196961 BINDING SITE, designated SEQ ID:42434, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37740] Another function of VGAM1023 is therefore inhibition of LOC196961 (Accession XM_113790). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196961. LOC197138 (Accession XM_113829) is another VGAM1023 host target gene. LOC197138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197138 BINDING SITE, designated SEQ ID:42452, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37741] Another function of VGAM1023 is therefore inhibition of LOC197138 (Accession XM_113829). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197138. LOC200014 (Accession XM_114087) is another VGAM1023 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42687, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37742] Another function of VGAM1023 is therefore inhibition of LOC200014 (Accession XM_114087). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. LOC202018 (Accession XM_114420) is another VGAM1023 host target gene. LOC202018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202018, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202018 BINDING SITE, designated SEQ ID:42956, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37743] Another function of VGAM1023 is therefore inhibition of LOC202018 (Accession XM_114420). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202018. LOC245727 (Accession XM_165913) is another VGAM1023 host target gene. LOC245727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC245727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245727 BINDING SITE, designated SEQ ID:43794, to the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, also designated SEQ ID:3734.

[37744] Another function of VGAM1023 is therefore inhibition of LOC245727 (Accession XM_165913). Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC245727. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1024 (VGAM1024) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37745] VGAM1024 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1024 was detected is described hereinabove with reference to Figs. 1–8.

[37746] VGAM1024 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal Yellow Dwarf Virus – RPV. VGAM1024 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37747] VGAM1024 gene encodes a VGAM1024 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1024 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1024 precursor RNA is designated SEQ ID:1010, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1010 is located at position 672 relative to the genome of Cereal Yellow Dwarf Virus – RPV.

- [37748] VGAM1024 precursor RNA folds onto itself, forming VGAM1024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.
- [37749] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1024 folded precursor RNA into VGAM1024 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1024 RNA is designated SEQ ID:3735, and is provided hereinbelow with reference to the sequence listing part.

[37750] VGAM1024 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1024 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1024 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37751] VGAM1024 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1024 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1024 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1024 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1024 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37752] The complementary binding of VGAM1024 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1024 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1024 host target RNA into VGAM1024 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37753] It is appreciated that VGAM1024 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1024 host target genes. The mRNA of each one of this plurality of VGAM1024 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1024 RNA, herein designated VGAM RNA, and which when bound by VGAM1024 RNA causes

inhibition of translation of respective one or more VGAM1024 host target proteins.

[37754] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1024 gene, herein designated VGAM GENE, on one or more VGAM1024 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37755] It is yet further appreciated that a function of VGAM1024 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1024 include diagnosis, prevention and

treatment of viral infection by Cereal Yellow Dwarf Virus – RPV. Specific functions, and accordingly utilities, of VGAM1024 correlate with, and may be deduced from, the identity of the host target genes which VGAM1024 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37756] Nucleotide sequences of the VGAM1024 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1024 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1024 are further described hereinbelow with reference to Table 1.

[37757] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM1024 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1024 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37758] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1024 gene, herein designated VGAM is inhibition of expression of VGAM1024 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1024 correlate with, and may be deduced from, the identity of the target genes which VGAM1024 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37759] Retinoic Acid Induced 3 (RAI3, Accession NM_003979) is a VGAM1024 host target gene. RAI3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI3 BINDING SITE, designated SEQ ID:10111, to the nucleotide sequence of VGAM1024 RNA, herein designated VGAM RNA, also designated SEQ ID:3735.

[37760] A function of VGAM1024 is therefore inhibition of Retinoic Acid Induced 3 (RAI3, Accession NM_003979). Accordingly, utilities of VGAM1024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI3. START Domain Containing 4, Sterol Regulated (STARD4, Accession NM_139164) is another VGAM1024 host target gene. STARD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by STARD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STARD4 BINDING SITE, designated SEQ ID:29172, to the nucleotide sequence of VGAM1024 RNA, herein designated VGAM RNA, also designated SEQ ID:3735.

[37761] Another function of VGAM1024 is therefore inhibition of START Domain Containing 4, Sterol Regulated (STARD4, Accession NM_139164). Accordingly, utilities of VGAM1024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD4. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662) is another VGAM1024 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19194, to the nucleotide sequence of VGAM1024 RNA, herein designated VGAM RNA, also designated SEQ ID:3735.

[37762] Another function of VGAM1024 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM1024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of TRPM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776) is another VGAM1024 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:16598, SEQ ID:27680 and SEQ ID:27693 respectively, to the nucleotide sequence of VGAM1024 RNA, herein designated VGAM RNA, also designated SEQ ID:3735.

[37763] Another function of VGAM1024 is therefore inhibition of G

Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776). Accordingly, utilities of VGAM1024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. LOC90408 (Accession XM_031517) is another VGAM1024 host target gene. LOC90408 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90408 BINDING SITE, designated SEQ ID:31396, to the nucleotide sequence of VGAM1024 RNA, herein designated VGAM RNA, also designated SEQ ID:3735.

[37764] Another function of VGAM1024 is therefore inhibition of LOC90408 (Accession XM_031517). Accordingly, utilities of VGAM1024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90408. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1025 (VGAM1025) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[37765] VGAM1025 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1025 was detected is described hereinabove with reference to Figs. 1–8.

[37766] VGAM1025 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal Yellow Dwarf Virus – RPV. VGAM1025 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37767] VGAM1025 gene encodes a VGAM1025 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1025 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1025 precursor RNA is designated SEQ ID:1011, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1011 is located at position 3393 relative to the genome of Cereal Yellow Dwarf Virus – RPV.

[37768] VGAM1025 precursor RNA folds onto itself, forming VGAM1025 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37769] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1025 folded precursor RNA into VGAM1025 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM1025 RNA is designated SEQ ID:3736, and is provided hereinbelow with reference to the sequence listing part.

[37770] VGAM1025 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1025 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1025 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37771] VGAM1025 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1025 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1025 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1025 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1025 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37772] The complementary binding of VGAM1025 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1025 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1025 host target RNA into VGAM1025 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37773] It is appreciated that VGAM1025 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1025 host target genes. The mRNA of each one of this plurality of VGAM1025 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1025 RNA, herein designated VGAM RNA, and which when bound by VGAM1025 RNA causes inhibition of translation of respective one or more VGAM1025 host target proteins.

[37774] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1025 gene, herein designated VGAM GENE, on one or more VGAM1025 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37775] It is yet further appreciated that a function of VGAM1025 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of viral infection by Cereal Yellow Dwarf Virus – RPV. Specific functions, and accordingly utilities, of VGAM1025 correlate with, and may be deduced from, the identity of the host target genes which VGAM1025 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[37776] Nucleotide sequences of the VGAM1025 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1025 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1025 are further described hereinbelow with reference to Table 1.

[37777] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1025 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1025 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37778] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1025 gene, herein designated VGAM is inhibition of expression of VGAM1025 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1025 correlate with, and may be deduced from, the identity of the target genes which VGAM1025 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37779] Annexin A7 (ANXA7, Accession NM_004034) is a VGAM1025 host target gene. ANXA7 BINDING SITE1 and ANXA7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANXA7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANXA7 BINDING SITE1 and ANXA7 BINDING SITE2, designated SEQ ID:10254 and SEQ ID:6825 respectively, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37780] A function of VGAM1025 is therefore inhibition of Annexin A7 (ANXA7, Accession NM_004034), a gene which promotes membrane fusion and is involved in exocytosis. Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANXA7. The function of ANXA7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM846. Potassium Voltage-gated Channel, KQT-like Subfamily, Member 1 (KCNQ1, Accession NM_000218) is

another VGAM1025 host target gene. KCNQ1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNQ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNQ1 BINDING SITE, designated SEQ ID:5725, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37781] Another function of VGAM1025 is therefore inhibition of Potassium Voltage-gated Channel, KQT-like Subfamily, Member 1 (KCNQ1, Accession NM_000218), a gene which probably important in cardiac repolarization. associates with kcne1 (mink) to form the i(ks) cardiac potassium current. elicits a rapidly activating, k(+)-selective outward current. muscarinic agonist oxotremorine-m strongly suppresses kcnq1/kcne1 current in cho cells in which cloned kcnq1/kcne1 channels were coexpressed with m1 muscarinic receptors. may associate also with kcne3 (mirp2) to form the potassium channel that is important for cyclic amp-stimulated intestinal secretion of chloride io TISSUE:abondantly expressed in heart, pancreas, prostate, kidney, small intestine and peripheral blood

leukocytes. less abundant in placenta, lung, spleen, colon, thymus, testis and ovaries. Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNQ1. The function of KCNQ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM339.ATPase, Class II, Type 9A (ATP9A, Accession XM_030577) is another VGAM1025 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31088, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37782] Another function of VGAM1025 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. Chromosome 20 Open

Reading Frame 13 (C20orf13, Accession NM_017714) is another VGAM1025 host target gene. C20orf13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf13 BINDING SITE, designated SEQ ID:19301, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37783] Another function of VGAM1025 is therefore inhibition of Chromosome 20 Open Reading Frame 13 (C20orf13, Accession NM_017714). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf13. DKFZp566H0824 (Accession NM_017535) is another VGAM1025 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated

SEQ ID:18976, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37784] Another function of VGAM1025 is therefore inhibition of DKFZp566H0824 (Accession NM_017535). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824. IMPACT (Accession NM_018439) is another VGAM1025 host target gene. IMPACT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMPACT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPACT BINDING SITE, designated SEQ ID:20506, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37785] Another function of VGAM1025 is therefore inhibition of IMPACT (Accession NM_018439). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPACT. KIAA0010 (Accession NM_014671) is another VGAM1025 host target gene. KIAA0010 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0010 BINDING SITE, designated SEQ ID:16132, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37786] Another function of VGAM1025 is therefore inhibition of KIAA0010 (Accession NM_014671). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0010. KIAA0978 (Accession XM_047013) is another VGAM1025 host target gene. KIAA0978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0978 BINDING SITE, designated SEQ ID:34890, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37787] Another function of VGAM1025 is therefore inhibition of

KIAA0978 (Accession XM_047013). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0978. KIAA1550 (Accession XM_039393) is another VGAM1025 host target gene. KIAA1550 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:33072, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37788] Another function of VGAM1025 is therefore inhibition of KIAA1550 (Accession XM_039393). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550. LOC157918 (Accession XM_098842) is another VGAM1025 host target gene. LOC157918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:41900, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37789] Another function of VGAM1025 is therefore inhibition of LOC157918 (Accession XM_098842). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157918. LOC202347 (Accession XM_117390) is another VGAM1025 host target gene. LOC202347 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202347 BINDING SITE, designated SEQ ID:43432, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37790] Another function of VGAM1025 is therefore inhibition of LOC202347 (Accession XM_117390). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202347. LOC203504 (Accession XM_117550) is an-

other VGAM1025 host target gene. LOC203504 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203504 BINDING SITE, designated SEQ ID:43574, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37791] Another function of VGAM1025 is therefore inhibition of LOC203504 (Accession XM_117550). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203504. LOC257159 (Accession XM_173158) is another VGAM1025 host target gene. LOC257159 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257159 BINDING SITE, designated SEQ ID:46417, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37792] Another function of VGAM1025 is therefore inhibition of LOC257159 (Accession XM_173158). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257159. LOC89919 (Accession XM_027244) is another VGAM1025 host target gene. LOC89919 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89919 BINDING SITE, designated SEQ ID:30466, to the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, also designated SEQ ID:3736.

[37793] Another function of VGAM1025 is therefore inhibition of LOC89919 (Accession XM_027244). Accordingly, utilities of VGAM1025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89919. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1026 (VGAM1026) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[37794] VGAM1026 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1026 was detected is described hereinabove with reference to Figs. 1–8.

[37795] VGAM1026 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal Yellow Dwarf Virus – RPV. VGAM1026 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37796] VGAM1026 gene encodes a VGAM1026 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1026 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1026 precursor RNA is designated SEQ ID:1012, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1012 is located at position 1766 relative to the genome of Cereal Yellow Dwarf Virus – RPV.

[37797] VGAM1026 precursor RNA folds onto itself, forming VGAM1026 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37798] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1026 folded precursor RNA into VGAM1026 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1026 RNA is designated SEQ ID:3737, and is provided hereinbelow with reference to the sequence listing part.

[37799] VGAM1026 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1026 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1026 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37800] VGAM1026 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1026 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1026 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1026 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1026 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37801] The complementary binding of VGAM1026 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1026 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1026 host target RNA into VGAM1026 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37802] It is appreciated that VGAM1026 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1026 host target genes. The mRNA of each one of this plurality of VGAM1026 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1026 RNA, herein designated VGAM RNA, and which when bound by VGAM1026 RNA causes inhibition of translation of respective one or more VGAM1026 host target proteins.

[37803] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1026 gene, herein designated VGAM GENE, on one or more VGAM1026 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37804] It is yet further appreciated that a function of VGAM1026 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of viral infection by Cereal Yellow Dwarf Virus – RPV. Specific functions, and accordingly utilities, of VGAM1026 correlate with, and may be deduced from, the identity of the host target genes which VGAM1026 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[37805] Nucleotide sequences of the VGAM1026 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1026 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1026 are further described hereinbelow with reference to Table 1.

[37806] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1026 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1026 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37807] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1026 gene, herein designated VGAM is inhibition of expression of VGAM1026 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1026 correlate with, and may be deduced from, the identity of the target genes which VGAM1026 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37808] CERD4 (Accession NM_012074) is a VGAM1026 host target gene. CERD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CERD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CERD4 BINDING SITE, designated SEQ ID:14349, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37809] A function of VGAM1026 is therefore inhibition of CERD4 (Accession NM_012074). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CERD4. Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM_024009) is another VGAM1026 host target gene. GJB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GJB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJB3 BINDING SITE, designated SEQ ID:23438, to the nucleotide sequence of VGAM1026 RNA, herein

designated VGAM RNA, also designated SEQ ID:3737.

[37810] Another function of VGAM1026 is therefore inhibition of Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM_024009). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJB3. Kinesin Family Member 1B (KIF1B, Accession NM_015074) is another VGAM1026 host target gene. KIF1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF1B BINDING SITE, designated SEQ ID:17449, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37811] Another function of VGAM1026 is therefore inhibition of Kinesin Family Member 1B (KIF1B, Accession NM_015074), a gene which motor for anterograde transport of mitochondria. has a microtubule plus end-directed motility. Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF1B. The function of KIF1B has

been established by previous studies. Nangaku et al. (1994) cloned a member of the mouse kinesin superfamily, Kif1b, which encodes an N-terminal-type motor protein. Kif1b was expressed in all tissues tested. In situ hybridization revealed that Kif1b is expressed abundantly in differentiated nerve cells. The authors found that Kif1b works as a monomer, having a microtubule plus-end-directed motility. Rotary shadowing electron microscopy revealed mostly single globular structures. Immunocytochemically, Kif1b was colocalized with mitochondria in vivo. A subcellular fractionation study showed that Kif1b is concentrated in the mitochondrial fraction, and purified Kif1b could transport mitochondria along microtubules in vitro. These data suggested that Kif1b works as a monomeric motor for anterograde transport of mitochondria. Zhao et al. (2001) identified an isoform of mouse Kif1b, which they called Kif1b-beta, that is distinct from Kif1b-alpha (Nangaku et al., 1994) in its cargo-binding domain. Yang et al. (2001) identified the KIF1B gene in a homozygously deleted region of chromosome 1p36.2 in a neuroblastoma cell line. They reported results suggesting that the gene is not a candidate for tumor suppressor gene of neuroblastoma. Northern blot analysis

demonstrated that human KIF1B has at least 2 isoforms. The long isoform (KIF1B-beta) was expressed in a wide variety of tissues, while the short isoform (KIF1B-alpha) was detected only in adult testis.

[37812] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37813] Yang, H. W.; Chen, Y. Z.; Takita, J.; Soeda, E.; Piao, H. Y.; Hayashi, Y. : Genomic structure and mutational analysis of the human KIF1B gene which is homozygously deleted in neuroblastoma at chromosome 1p36.2. Oncogene 20: 5075-5083, 2001. ; and

[37814] Nangaku, M.; Sato-Yoshitake, R.; Okada, Y.; Noda, Y.; Takemura, R.; Yamazaki, H.; Hirokawa, N. : KIF1B, a novel microtubule plus end-directed monomeric motor protein for transport of mi.

[37815] Further studies establishing the function and utilities of KIF1B are found in John Hopkins OMIM database record ID 605995, and in cited publications numbered 4431-443 and 2276 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237) is another VGAM1026 host target gene.

POU4F1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU4F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU4F1 BINDING SITE, designated SEQ ID:12897, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37816] Another function of VGAM1026 is therefore inhibition of POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237), a gene which plays a role in the regulation of specific gene expression within a subset of neuronal lineages. Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU4F1. The function of POU4F1 has been established by previous studies. BRN3A (OMIM Ref. No. POU4F1) is a class IV POU domain-containing transcription factor highly expressed in the developing sensory nervous system and in cells of the B- and T-lymphocytic lineages (Gerrero et al., 1993). Xiang et al. (1995) analyzed the expression patterns of brn3a, brn3b, and brn3c in fetal and adult mouse retina and

brain. Antibodies to brn3a identify a large fraction of retinal ganglion cells. The 3 factors identify overlapping subsets of retinal ganglion cells and of neurons in the dorsal root and trigeminal ganglia, suggesting that primary somatosensory neurons and retinal ganglion cells share genetic regulatory hierarchies.

[37817] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37818] Gerrero, M. R.; McEvilly, R. J.; Turner, E.; Lin, C. R.; O'Connell, S.; Jenne, K. J.; Hobbs, M. V.; Rosenfeld, M. G. : Brn-3.0: a POU-domain protein expressed in the sensory immune and endocrine systems that functions on elements distinct from known octamer motifs. Proc. Nat. Acad. Sci. 90: 10841-10845, 1993. ; and

[37819] Xiang, M.; Zhou, L.; Macke, J. P.; Yoshioka, T.; Hendry, S. H. C.; Eddy, R. L.; Shows, T. B.; Nathans, J. : The Brn-3 family of POU-domain factors: primary structure, binding specificity, a.

[37820] Further studies establishing the function and utilities of POU4F1 are found in John Hopkins OMIM database record ID 601632, and in cited publications numbered 2805-2806, 2018, 280 and 3699 listed in the bibliogra-

phy section hereinbelow, which are also hereby incorporated by reference. BCL2/adenovirus E1B 19kDa Interacting Protein 2 (BNIP2, Accession XM_039703) is another VGAM1026 host target gene. BNIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BNIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BNIP2 BINDING SITE, designated SEQ ID:33163, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37821] Another function of VGAM1026 is therefore inhibition of BCL2/adenovirus E1B 19kDa Interacting Protein 2 (BNIP2, Accession XM_039703). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNIP2. Chromosome 20 Open Reading Frame 173 (C20orf173, Accession NM_080828) is another VGAM1026 host target gene. C20orf173 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf173 BINDING SITE, designated SEQ ID:28092, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37822] Another function of VGAM1026 is therefore inhibition of Chromosome 20 Open Reading Frame 173 (C20orf173, Accession NM_080828). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf173. DJ122O8.2 (Accession NM_020466) is another VGAM1026 host target gene. DJ122O8.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ122O8.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ122O8.2 BINDING SITE, designated SEQ ID:21704, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37823] Another function of VGAM1026 is therefore inhibition of DJ122O8.2 (Accession NM_020466). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DJ122O8.2. DKFZp547A023 (Accession XM_052065) is another VGAM1026 host target gene. DKFZp547A023 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547A023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547A023 BINDING SITE, designated SEQ ID:35941, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37824] Another function of VGAM1026 is therefore inhibition of DKFZp547A023 (Accession XM_052065). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547A023. FLJ10607 (Accession XM_085119) is another VGAM1026 host target gene. FLJ10607 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ10607 BINDING SITE, designated SEQ ID:37833, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37825] Another function of VGAM1026 is therefore inhibition of FLJ10607 (Accession XM_085119). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10607. FLJ22795 (Accession NM_025084) is another VGAM1026 host target gene. FLJ22795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22795 BINDING SITE, designated SEQ ID:24689, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37826] Another function of VGAM1026 is therefore inhibition of FLJ22795 (Accession NM_025084). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22795. Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM_021903) is another VGAM1026

host target gene. GABBR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GABBR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:22419, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37827] Another function of VGAM1026 is therefore inhibition of Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM_021903). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1. KIAA0377 (Accession NM_014659) is another VGAM1026 host target gene. KIAA0377 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0377, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0377 BINDING SITE, designated SEQ ID:16102, to the nucleotide sequence of VGAM1026 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3737.

[37828] Another function of VGAM1026 is therefore inhibition of KIAA0377 (Accession NM_014659). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0377. KIAA0546 (Accession XM_049055) is another VGAM1026 host target gene. KIAA0546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0546 BINDING SITE, designated SEQ ID:35334, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37829] Another function of VGAM1026 is therefore inhibition of KIAA0546 (Accession XM_049055). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0546. KIAA1348 (Accession XM_043826) is another VGAM1026 host target gene. KIAA1348 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1348, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1348 BINDING SITE, designated SEQ ID:34033, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37830] Another function of VGAM1026 is therefore inhibition of KIAA1348 (Accession XM_043826). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1348. KIAA1706 (Accession XM_166595) is another VGAM1026 host target gene. KIAA1706 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1706 BINDING SITE, designated SEQ ID:44574, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37831] Another function of VGAM1026 is therefore inhibition of KIAA1706 (Accession XM_166595). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1706. RNP24 (Accession NM_006815) is another VGAM1026 host target gene. RNP24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNP24 BINDING SITE, designated SEQ ID:13692, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37832] Another function of VGAM1026 is therefore inhibition of RNP24 (Accession NM_006815). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNP24. LOC145717 (Accession XM_039771) is another VGAM1026 host target gene. LOC145717 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145717 BINDING SITE, designated SEQ ID:33192, to

the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37833] Another function of VGAM1026 is therefore inhibition of LOC145717 (Accession XM_039771). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145717. LOC145725 (Accession XM_085211) is another VGAM1026 host target gene. LOC145725 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145725 BINDING SITE, designated SEQ ID:37948, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37834] Another function of VGAM1026 is therefore inhibition of LOC145725 (Accession XM_085211). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145725. LOC145732 (Accession XM_085218) is another VGAM1026 host target gene. LOC145732 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC145732, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145732 BINDING SITE, designated SEQ ID:37957, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37835] Another function of VGAM1026 is therefore inhibition of LOC145732 (Accession XM_085218). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145732. LOC196957 (Accession XM_113789) is another VGAM1026 host target gene. LOC196957 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196957 BINDING SITE, designated SEQ ID:42429, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37836] Another function of VGAM1026 is therefore inhibition of LOC196957 (Accession XM_113789). Accordingly, utilities

of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196957. LOC196961 (Accession XM_113790) is another VGAM1026 host target gene. LOC196961 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196961 BINDING SITE, designated SEQ ID:42438, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37837] Another function of VGAM1026 is therefore inhibition of LOC196961 (Accession XM_113790). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196961. LOC197138 (Accession XM_113829) is another VGAM1026 host target gene. LOC197138 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC197138 BINDING SITE, designated SEQ ID:42456, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37838] Another function of VGAM1026 is therefore inhibition of LOC197138 (Accession XM_113829). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197138. LOC220537 (Accession XM_165406) is another VGAM1026 host target gene. LOC220537 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220537 BINDING SITE, designated SEQ ID:43622, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37839] Another function of VGAM1026 is therefore inhibition of LOC220537 (Accession XM_165406). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220537. LOC245727 (Accession XM_165913) is another VGAM1026 host target gene. LOC245727 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245727 BINDING SITE, designated SEQ ID:43797, to the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, also designated SEQ ID:3737.

[37840] Another function of VGAM1026 is therefore inhibition of LOC245727 (Accession XM_165913). Accordingly, utilities of VGAM1026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245727. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1027 (VGAM1027) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37841] VGAM1027 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1027 was detected is described hereinabove with reference to Figs. 1-8.

[37842] VGAM1027 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid Herpesvirus 1. VGAM1027 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37843] VGAM1027 gene encodes a VGAM1027 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1027 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1027 precursor RNA is designated SEQ ID:1013, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1013 is located at position 89420 relative to the genome of Ictalurid Herpesvirus 1.

[37844] VGAM1027 precursor RNA folds onto itself, forming VGAM1027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[37845] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1027 folded precursor RNA into VGAM1027 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1027 RNA is designated SEQ ID:3738, and is provided hereinbelow with reference to the sequence listing part.

[37846] VGAM1027 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1027 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1027 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37847] VGAM1027 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1027 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1027 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1027 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1027 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37848] The complementary binding of VGAM1027 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1027 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1027 host target RNA into VGAM1027 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37849] It is appreciated that VGAM1027 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1027 host target genes. The mRNA of each one of this plurality of VGAM1027 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1027 RNA, herein designated VGAM RNA, and which when bound by VGAM1027 RNA causes inhibition of translation of respective one or more VGAM1027 host target proteins.

[37850] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1027 gene, herein designated VGAM GENE, on one or more VGAM1027 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37851] It is yet further appreciated that a function of VGAM1027 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of viral infection by Ictalurid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1027 correlate with, and may be deduced from, the identity of the host target genes which VGAM1027 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37852] Nucleotide sequences of the VGAM1027 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1027 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1027 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1027 are further described hereinbelow with reference to Table 1.

[37853] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1027 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1027 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37854] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1027 gene, herein designated VGAM is inhibition of expression of VGAM1027 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1027 correlate with, and may be deduced from, the identity of the target genes which VGAM1027 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37855] BarH-like Homeobox 1 (BARX1, Accession NM_021570) is a VGAM1027 host target gene. BARX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BARX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of BARX1 BINDING SITE, designated SEQ ID:22236, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37856] A function of VGAM1027 is therefore inhibition of BarH-like Homeobox 1 (BARX1, Accession NM_021570), a gene which involves in craniofacial development, in odontogenesis and in stomach organogenesis. Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BARX1. The function of BARX1 has been established by previous studies. Using the mouse Barx1 sequence to search sequence databases, followed by PCR screening of cDNA libraries, Gould and Walter (2000) isolated a cDNA encoding human BARX1. The predicted 226-amino acid protein is identical in the homeodomain to the mouse and chick sequences and is approximately 90% identical overall. Northern blot analysis detected expression of a 1.6-kb transcript, with highest expression in testis and heart and lower levels in other tissues. Genomic sequence analysis determined that the BARX1 gene contains 4 exons. Animal model experiments lend further support to the function of BARX1. In a series of expression studies in mouse, Tucker

et al. (1998) demonstrated that bone morphogenetic protein-4 (Bmp4) activates the expression of Msx1 (OMIM Ref. No. 142983), leading to incisor tooth development. BMP4 inhibited expression of Barx1, which marks presumptive molar teeth, and limits expression to the proximal, presumptive molar mesenchyme at embryonic day 10. Fibroblast growth factor-8 (FGF8; 600483) stimulated Barx1 expression. When BMP4 signaling in early development was inhibited by application of exogenous Noggin (OMIM Ref. No. 602991) protein, ectopic Barx1 expression resulted in transformation of tooth identity from incisor to molar

[37857] It is appreciated that the abovementioned animal model for BARX1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[37858] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37859] Gould, D. B.; Walter, M. A. : Cloning, characterization, localization, and mutational screening of the human BARX1 gene. Genomics 68: 336-342, 2000. ; and

[37860] Tucker, A. S.; Matthews, K. L.; Sharpe, P. T. : Transforma-

tion of tooth type induced by inhibition of BMP signaling. Science 282: 1136–1138, 1998.

[37861] Further studies establishing the function and utilities of BARX1 are found in John Hopkins OMIM database record ID 603260, and in cited publications numbered 8739–874 and 11637 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Forkhead Box E3 (FOXE3, Accession NM_012186) is another VGAM1027 host target gene. FOXE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXE3 BINDING SITE, designated SEQ ID:14469, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37862] Another function of VGAM1027 is therefore inhibition of Forkhead Box E3 (FOXE3, Accession NM_012186), a gene which regulates embryonic development. Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE3. The function of FOXE3 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM632. Glucose-6-phosphate Dehydrogenase (G6PD, Accession NM_000402) is another VGAM1027 host target gene. G6PD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by G6PD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PD BINDING SITE, designated SEQ ID:5979, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37863] Another function of VGAM1027 is therefore inhibition of Glucose-6-phosphate Dehydrogenase (G6PD, Accession NM_000402), a gene which produces pentose sugars for nucleic acid synthesis and main producer of nadph reducing power. Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PD. The function of G6PD has been established by previous studies. Since identification of deficiency of G6PD (Carson et al., 1956) and of its X-chromosomal determination (Childs et al., 1958) in the

1950s and demonstration of electrophoretic variants of this enzyme in the early 1960s (Boyer et al., 1962), the genetic, clinical and biochemical significance of this polymorphism has been found to be great. G6PD is in the hexose monophosphate pathway, the only NADPH-generation process in mature red cells, which lack the citric acid cycle. For this reason G6PD deficiency has adverse physiologic effects. Deficiency of the red cell enzyme, in various forms, is the basis of favism, primaquine sensitivity and some other drug-sensitive hemolytic anemias, anemia and jaundice in the newborn, and chronic nonspherocytic hemolytic anemia (Beutler et al., 1968). Beaconsfield et al. (1965) advanced the hypothesis that the incidence of cancer is inversely related to the frequency of G6PD deficiency in blacks. Since the metabolism of xylitol remains intact in G6PD-dependent red cells, Wang et al. (1971) suggested use of xylitol in the treatment of hemolytic crisis. Different variants of the enzyme are found in high frequency in African, Mediterranean and Asiatic populations (Porter et al., 1964), and heterozygote advantage vis-a-vis malaria (Luzzatto et al., 1969) has been invoked to account for the high frequency of the particular alleles in particular populations. The variety of

forms of the enzyme is great, as illustrated by the published tables (Yoshida et al., 1971; Beutler and Yoshida, 1973; Yoshida and Beutler, 1978) and by the listing of allelic variants in this entry. The World Health Organization (363,364:WHO, 1967,1967) gave its attention to problems of nomenclature and standard procedures for study. The demonstrated polymorphism at this X-linked locus rivals that of the autosomal loci for the polypeptide chains of hemoglobin. As in the latter instance, single amino acid substitution has been demonstrated as the basis of the change in the G6PD molecule resulting from mutation (Yoshida et al., 1967). Polymorphism at the G6PD locus has made it a useful X-chromosome marker, like the colorblindness and Xg blood group loci; close linkage of the colorblindness loci, the G6PD locus, and the hemophilia A locus (Adam et al., 1966; Boyer and Graham, 1965) has been demonstrated. Also, as a biochemical phenotype identifiable at the cellular level, G6PD variants have been useful in somatic cell genetics, permitting, for example, one of the critical proofs in man of the Lyon hypothesis (Davidson et al., 1963). The relative stability of the X chromosome during evolution has been shown by the fact that the G6PD locus is X-borne also in a number of other

species (Ohno, 1967). That G6PD is X-linked in the mouse is supported by Epstein's finding (1969) that oocytes of XO females have half as much G6PD as do oocytes of XX female mice. The level of lactate dehydrogenase was the same. Epstein's conclusion was that the G6PD gene is X-linked in the mouse, that synthesis occurs in the oocyte and is dosage-dependent, and that X-inactivation does not occur in oocytes. G6PD and HPRT are linked in the Chinese hamster (Rosenstrauss and Chasin, 1975) and presumably are on the X chromosome as in man. By study of cell hybrids, Shows et al. (1976) found that HPRT and G6PD are closely linked in the Muntjac deer. Smith et al. (1976) found G6PD deficiency in a male Weimaraner dog, but were not able to do genetic studies. Alpha-GAL, HPRT, PGK and G6PD are X-linked in the rabbit, according to mouse-rabbit hybrid cell studies (Cianfriglia et al., 1979; Echard and Gillois, 1979). By comparable methods, Hors-Cayla et al. (1979) found them to be X-linked also in cattle. According to cell hybridization studies, HPRT, G6PD, and PGK are X-linked in the pig (Gellin et al., 1979) and in sheep (Saidi et al., 1979). Pretsch et al. (1988) recovered a mouse with X-linked G6PD deficiency from the offspring of 1-ethyl-1-nitrosourea-treated male mice. Using pulsed

field gel electrophoresis, Faust et al. (1992) demonstrated that, in the mouse, Gdx (OMIM Ref. No. 312070), P3 (OMIM Ref. No. 312090), and G6pd are physically linked to the X-linked visual pigment locus (Rsvp) within a maximal distance of 340 kb, while G6pd and Cf-8 (OMIM Ref. No. 306700) are approximately 900 kb apart.

[37864] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37865] Beutler, E.; Mathai, C. K.; Smith, J. E. : Biochemical variants of glucose-6-phosphate dehydrogenase giving rise to congenital nonspherocytic hemolytic disease. Blood 31: 131-150, 1968. ; and

[37866] Wang, Y. M.; Patterson, J. H.; Van Eys, J. : The potential use of xylitol in glucose-6-phosphate dehydrogenase deficiency anemia. J. Clin. Invest. 50: 1421-1428, 1971.

[37867] Further studies establishing the function and utilities of G6PD are found in John Hopkins OMIM database record ID 305900, and in cited publications numbered 11064-11075, 4212, 8019-8055, 8676-8678, 7352, 8679-8691, 8804-870 and 8258-8276 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate-cysteine Ligase, Modifier

Subunit (GCLM, Accession NM_002061) is another VGAM1027 host target gene. GCLM BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GCLM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCLM BINDING SITE, designated SEQ ID:7821, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37868] Another function of VGAM1027 is therefore inhibition of Glutamate-cysteine Ligase, Modifier Subunit (GCLM, Accession NM_002061), a gene which is GLUTAMATE-CYSTEINE LIGASE. Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCLM. The function of GCLM has been established by previous studies. Gamma-glutamylcysteine synthetase, also known as glutamate-cysteine ligase (EC 6.3.2.2), is the first rate-limiting enzyme in glutathione biosynthesis.

[37869] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37870] Gipp, J. J.; Bailey, H. H.; Mulcahy, R. T. : Cloning and sequencing of the cDNA for the light subunit of human liver gamma-glutamylcysteine synthetase and relative mRNA levels for heavy and light subunits in human normal tissues. *Biochem. Biophys. Res. Commun.* 206: 584–589, 1995. ; and

[37871] Tsuchiya, K.; Mulcahy, R. T.; Reid, L. L.; Disteché, C. M.; Kavanagh, T. J. : Mapping of the glutamate-cysteine ligase catalytic subunit gene (GLCLC) to human chromosome 6p12 and mouse c.

[37872] Further studies establishing the function and utilities of GCLM are found in John Hopkins OMIM database record ID 601176, and in cited publications numbered 9314–931 and 9320–9317 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Ret Finger Protein (RFP, Accession NM_006510) is another VGAM1027 host target gene. RFP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFP BINDING SITE, designated SEQ ID:13258, to the nucleotide sequence of

VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37873] Another function of VGAM1027 is therefore inhibition of Ret Finger Protein (RFP, Accession NM_006510), a gene which involves in transcriptional regulation and may act in male germ cell development . Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFP. The function of RFP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM302.SORCS2 (Accession NM_020777) is another VGAM1027 host target gene. SORCS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SORCS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS2 BINDING SITE, designated SEQ ID:21877, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37874] Another function of VGAM1027 is therefore inhibition of SORCS2 (Accession NM_020777). Accordingly, utilities of

VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS2. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is another VGAM1027 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:19003, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37875] Another function of VGAM1027 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. Centaurin, Gamma 2 (CENTG2, Accession NM_014914) is another VGAM1027 host target gene. CENTG2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CENTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTG2 BINDING SITE, designated SEQ ID:17158, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37876] Another function of VGAM1027 is therefore inhibition of Centaurin, Gamma 2 (CENTG2, Accession NM_014914). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTG2. DT1P1A10 (Accession XM_029187) is another VGAM1027 host target gene. DT1P1A10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DT1P1A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DT1P1A10 BINDING SITE, designated SEQ ID:30858, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37877] Another function of VGAM1027 is therefore inhibition of DT1P1A10 (Accession XM_029187). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DT1P1A10. E2IG3 (Accession NM_014366) is another VGAM1027 host target gene. E2IG3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by E2IG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2IG3 BINDING SITE, designated SEQ ID:15696, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37878] Another function of VGAM1027 is therefore inhibition of E2IG3 (Accession NM_014366). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2IG3. Epsin 2 (EPN2, Accession NM_014964) is another VGAM1027 host target gene. EPN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPN2 BINDING SITE, designated SEQ ID:17347, to the nucleotide sequence of

VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37879] Another function of VGAM1027 is therefore inhibition of Epsin 2 (EPN2, Accession NM_014964). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN2. FLJ20400 (Accession XM_039306) is another VGAM1027 host target gene. FLJ20400 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20400, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20400 BINDING SITE, designated SEQ ID:33045, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37880] Another function of VGAM1027 is therefore inhibition of FLJ20400 (Accession XM_039306). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20400. FLJ20979 (Accession NM_024121) is another VGAM1027 host target gene. FLJ20979 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by FLJ20979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20979 BINDING SITE, designated SEQ ID:23573, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37881] Another function of VGAM1027 is therefore inhibition of FLJ20979 (Accession NM_024121). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20979. FLJ21195 (Accession NM_022469) is another VGAM1027 host target gene. FLJ21195 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21195 BINDING SITE, designated SEQ ID:22826, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37882] Another function of VGAM1027 is therefore inhibition of FLJ21195 (Accession NM_022469). Accordingly, utilities of

VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21195. FLJ21562 (Accession NM_025113) is another VGAM1027 host target gene. FLJ21562 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21562 BINDING SITE, designated SEQ ID:24762, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37883] Another function of VGAM1027 is therefore inhibition of FLJ21562 (Accession NM_025113). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21562. KIAA0415 (Accession XM_166527) is another VGAM1027 host target gene. KIAA0415 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0415 BINDING SITE, designated SEQ ID:44476, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37884] Another function of VGAM1027 is therefore inhibition of KIAA0415 (Accession XM_166527). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0415. KIAA0683 (Accession NM_016111) is another VGAM1027 host target gene. KIAA0683 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0683, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0683 BINDING SITE, designated SEQ ID:18191, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37885] Another function of VGAM1027 is therefore inhibition of KIAA0683 (Accession NM_016111). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0683. KIAA1643 (Accession XM_035371) is another VGAM1027 host target gene. KIAA1643 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1643 BINDING SITE, designated SEQ ID:32240, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37886] Another function of VGAM1027 is therefore inhibition of KIAA1643 (Accession XM_035371). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1643. MGC10986 (Accession NM_030576) is another VGAM1027 host target gene. MGC10986 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC10986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10986 BINDING SITE, designated SEQ ID:24950, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37887] Another function of VGAM1027 is therefore inhibition of

MGC10986 (Accession NM_030576). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10986. Phosphatidylserine Synthase 2 (PTDSS2, Accession NM_030783) is another VGAM1027 host target gene. PTDSS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTDSS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTDSS2 BINDING SITE, designated SEQ ID:25075, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37888] Another function of VGAM1027 is therefore inhibition of Phosphatidylserine Synthase 2 (PTDSS2, Accession NM_030783). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTDSS2. LOC254057 (Accession XM_173085) is another VGAM1027 host target gene. LOC254057 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254057, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254057 BINDING SITE, designated SEQ ID:46344, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37889] Another function of VGAM1027 is therefore inhibition of LOC254057 (Accession XM_173085). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254057. LOC254528 (Accession XM_170797) is another VGAM1027 host target gene. LOC254528 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254528 BINDING SITE, designated SEQ ID:45567, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37890] Another function of VGAM1027 is therefore inhibition of LOC254528 (Accession XM_170797). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC254528. LOC257479 (Accession XM_171548) is another VGAM1027 host target gene. LOC257479 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257479 BINDING SITE, designated SEQ ID:46052, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37891] Another function of VGAM1027 is therefore inhibition of LOC257479 (Accession XM_171548). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257479. LOC56926 (Accession XM_052629) is another VGAM1027 host target gene. LOC56926 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC56926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56926 BINDING SITE, designated SEQ ID:36042, to the

nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37892] Another function of VGAM1027 is therefore inhibition of LOC56926 (Accession XM_052629). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56926. LOC56961 (Accession XM_031857) is another VGAM1027 host target gene. LOC56961 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56961 BINDING SITE, designated SEQ ID:31507, to the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, also designated SEQ ID:3738.

[37893] Another function of VGAM1027 is therefore inhibition of LOC56961 (Accession XM_031857). Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56961. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1028 (VGAM1028) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37894] VGAM1028 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1028 was detected is described hereinabove with reference to Figs. 1–8.

[37895] VGAM1028 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid Herpesvirus 1. VGAM1028 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37896] VGAM1028 gene encodes a VGAM1028 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1028 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1028 precursor RNA is designated SEQ ID:1014, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1014 is located at position 86483 relative to the genome of Ictalurid Herpesvirus 1.

[37897] VGAM1028 precursor RNA folds onto itself, forming VGAM1028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37898] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1028 folded precursor RNA into VGAM1028 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1028 RNA is designated SEQ ID:3739, and is provided hereinbelow with reference to the sequence listing part.

[37899] VGAM1028 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1028 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1028 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[37900] VGAM1028 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1028 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1028 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1028 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1028 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37901] The complementary binding of VGAM1028 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1028 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1028 host target RNA into VGAM1028 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37902] It is appreciated that VGAM1028 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1028 host target genes. The mRNA of each one of this plurality of VGAM1028 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1028 RNA, herein designated VGAM RNA, and which when bound by VGAM1028 RNA causes inhibition of translation of respective one or more VGAM1028 host target proteins.

[37903] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1028 gene, herein designated VGAM GENE, on one or more VGAM1028 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37904] It is yet further appreciated that a function of VGAM1028 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1028 include diagnosis, prevention and treatment of viral infection by Ictalurid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1028 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1028 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37905] Nucleotide sequences of the VGAM1028 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1028 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1028 are further described hereinbelow with reference to Table 1.

[37906] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1028 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1028 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37907] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1028 gene, herein designated VGAM is inhibition of expression of VGAM1028 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1028 correlate with, and may be deduced from, the identity of the target genes which VGAM1028

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37908] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974) is a VGAM1028 host target gene. AKAP13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:43174, to the nucleotide sequence of VGAM1028 RNA, herein designated VGAM RNA, also designated SEQ ID:3739.

[37909] A function of VGAM1028 is therefore inhibition of A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM1028 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM17.DKFZP434N014 (Accession XM_027012) is another VGAM1028 host target gene. DK-

FZP434N014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434N014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N014 BINDING SITE, designated SEQ ID:30388, to the nucleotide sequence of VGAM1028 RNA, herein designated VGAM RNA, also designated SEQ ID:3739.

[37910] Another function of VGAM1028 is therefore inhibition of DKFZP434N014 (Accession XM_027012). Accordingly, utilities of VGAM1028 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N014. FLJ23598 (Accession NM_024783) is another VGAM1028 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598 BINDING SITE, designated SEQ ID:24152, to the nucleotide sequence of VGAM1028 RNA, herein designated VGAM RNA, also designated SEQ ID:3739.

[37911] Another function of VGAM1028 is therefore inhibition of FLJ23598 (Accession NM_024783). Accordingly, utilities of VGAM1028 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23598. LOC149086 (Accession XM_097580) is another VGAM1028 host target gene. LOC149086 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149086 BINDING SITE, designated SEQ ID:40945, to the nucleotide sequence of VGAM1028 RNA, herein designated VGAM RNA, also designated SEQ ID:3739.

[37912] Another function of VGAM1028 is therefore inhibition of LOC149086 (Accession XM_097580). Accordingly, utilities of VGAM1028 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149086. LOC92568 (Accession XM_045852) is another VGAM1028 host target gene. LOC92568 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92568, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:34572, to the nucleotide sequence of VGAM1028 RNA, herein designated VGAM RNA, also designated SEQ ID:3739.

[37913] Another function of VGAM1028 is therefore inhibition of LOC92568 (Accession XM_045852). Accordingly, utilities of VGAM1028 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1029 (VGAM1029) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37914] VGAM1029 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1029 was detected is described hereinabove with reference to Figs. 1–8.

[37915] VGAM1029 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Yellow Dwarf Virus – PAV. VGAM1029 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37916] VGAM1029 gene encodes a VGAM1029 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1029 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1029 precursor RNA is designated SEQ ID:1015, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1015 is located at position 1469 relative to the genome of Barley Yellow Dwarf Virus – PAV.

[37917] VGAM1029 precursor RNA folds onto itself, forming VGAM1029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37918] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1029 folded precursor RNA into VGAM1029

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1029 RNA is designated SEQ ID:3740, and is provided hereinbelow with reference to the sequence listing part.

[37919] VGAM1029 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1029 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1029 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37920] VGAM1029 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1029 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1029 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1029 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1029 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37921] The complementary binding of VGAM1029 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1029 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1029 host target RNA into VGAM1029 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[37922] It is appreciated that VGAM1029 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1029 host target genes. The mRNA of each one of this plurality of VGAM1029 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1029 RNA, herein designated VGAM RNA, and which when bound by VGAM1029 RNA causes inhibition of translation of respective one or more VGAM1029 host target proteins.

[37923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1029 gene, herein designated VGAM GENE, on one or more VGAM1029 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37924] It is yet further appreciated that a function of VGAM1029 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1029 include diagnosis, prevention and treatment of viral infection by Barley Yellow Dwarf Virus – PAV. Specific functions, and accordingly utilities, of VGAM1029 correlate with, and may be deduced from, the identity of the host target genes which VGAM1029 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37925] Nucleotide sequences of the VGAM1029 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1029 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1029 are further described hereinbelow with reference to Table 1.

[37926] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1029 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1029 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37927] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1029 gene, herein designated VGAM is inhibition of expression of VGAM1029 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1029 correlate with, and may be deduced from, the identity of the target genes which VGAM1029 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37928] Glycine Receptor, Alpha 3 (GLRA3, Accession XM_011092) is a VGAM1029 host target gene. GLRA3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GLRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLRA3 BINDING SITE, designated SEQ ID:30167, to the nucleotide sequence of VGAM1029 RNA, herein designated VGAM RNA,

also designated SEQ ID:3740.

[37929] A function of VGAM1029 is therefore inhibition of Glycine Receptor, Alpha 3 (GLRA3, Accession XM_011092), a gene which increases the chloride conductance and thus produces hyperpolarization (inhibition of neuronal firing). Accordingly, utilities of VGAM1029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLRA3. The function of GLRA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM602.ATP-binding Cassette, Sub-family A (ABC1), Member 9 (ABCA9, Accession NM_080283) is another VGAM1029 host target gene. ABCA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA9 BINDING SITE, designated SEQ ID:27827, to the nucleotide sequence of VGAM1029 RNA, herein designated VGAM RNA, also designated SEQ ID:3740.

[37930] Another function of VGAM1029 is therefore inhibition of

ATP-binding Cassette, Sub-family A (ABC1), Member 9 (ABCA9, Accession NM_080283). Accordingly, utilities of VGAM1029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA9. Histamine Receptor H3 (HRH3, Accession NM_007232) is another VGAM1029 host target gene. HRH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH3 BINDING SITE, designated SEQ ID:14109, to the nucleotide sequence of VGAM1029 RNA, herein designated VGAM RNA, also designated SEQ ID:3740.

[37931] Another function of VGAM1029 is therefore inhibition of Histamine Receptor H3 (HRH3, Accession NM_007232). Accordingly, utilities of VGAM1029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH3. KIAA0892 (Accession XM_048457) is another VGAM1029 host target gene. KIAA0892 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0892, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0892 BINDING SITE, designated SEQ ID:35168, to the nucleotide sequence of VGAM1029 RNA, herein designated VGAM RNA, also designated SEQ ID:3740.

[37932] Another function of VGAM1029 is therefore inhibition of KIAA0892 (Accession XM_048457). Accordingly, utilities of VGAM1029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0892. KIAA1546 (Accession XM_042301) is another VGAM1029 host target gene. KIAA1546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1546 BINDING SITE, designated SEQ ID:33715, to the nucleotide sequence of VGAM1029 RNA, herein designated VGAM RNA, also designated SEQ ID:3740.

[37933] Another function of VGAM1029 is therefore inhibition of KIAA1546 (Accession XM_042301). Accordingly, utilities of VGAM1029 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1546. LOC149832 (Accession XM_097733) is another VGAM1029 host target gene. LOC149832 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149832 BINDING SITE, designated SEQ ID:41079, to the nucleotide sequence of VGAM1029 RNA, herein designated VGAM RNA, also designated SEQ ID:3740.

[37934] Another function of VGAM1029 is therefore inhibition of LOC149832 (Accession XM_097733). Accordingly, utilities of VGAM1029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149832. LOC152274 (Accession XM_087418) is another VGAM1029 host target gene. LOC152274 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152274 BINDING SITE, designated SEQ ID:39234, to

the nucleotide sequence of VGAM1029 RNA, herein designated VGAM RNA, also designated SEQ ID:3740.

[37935] Another function of VGAM1029 is therefore inhibition of LOC152274 (Accession XM_087418). Accordingly, utilities of VGAM1029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152274. LOC157247 (Accession XM_088275) is another VGAM1029 host target gene. LOC157247 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157247 BINDING SITE, designated SEQ ID:39571, to the nucleotide sequence of VGAM1029 RNA, herein designated VGAM RNA, also designated SEQ ID:3740.

[37936] Another function of VGAM1029 is therefore inhibition of LOC157247 (Accession XM_088275). Accordingly, utilities of VGAM1029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157247. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1030 (VGAM1030) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37937] VGAM1030 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1030 was detected is described hereinabove with reference to Figs. 1–8.

[37938] VGAM1030 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Mild Yellowing Virus. VGAM1030 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37939] VGAM1030 gene encodes a VGAM1030 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1030 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1030 precursor RNA is designated SEQ ID:1016, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1016 is located at position 3757 relative to the genome of Beet Mild Yellowing Virus.

[37940] VGAM1030 precursor RNA folds onto itself, forming VGAM1030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37941] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1030 folded precursor RNA into VGAM1030 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1030 RNA is designated SEQ ID:3741, and is provided hereinbelow with reference to the sequence listing part.

[37942] VGAM1030 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1030 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1030 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37943] VGAM1030 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1030 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1030 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1030 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1030 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37944] The complementary binding of VGAM1030 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1030 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1030 host target RNA into VGAM1030 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37945] It is appreciated that VGAM1030 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1030 host target genes. The mRNA of each one of this plurality of VGAM1030 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1030 RNA, herein designated VGAM RNA, and which when bound by VGAM1030 RNA causes inhibition of translation of respective one or more VGAM1030 host target proteins.

[37946] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1030 gene, herein designated VGAM GENE, on one or more VGAM1030 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37947] It is yet further appreciated that a function of VGAM1030 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of viral infection by Beet Mild Yellowing Virus. Specific functions, and accordingly utilities, of VGAM1030 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1030 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37948] Nucleotide sequences of the VGAM1030 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1030 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1030 are further described hereinbelow with reference to Table 1.

[37949] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1030 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1030 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37950] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1030 gene, herein designated VGAM is inhibition of expression of VGAM1030 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1030 correlate with, and may be deduced from, the identity of the target genes which VGAM1030

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37951] Low Density Lipoprotein Receptor (familial hypercholesterolemia) (LDLR, Accession NM_000527) is a VGAM1030 host target gene. LDLR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LDLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDLR BINDING SITE, designated SEQ ID:6125, to the nucleotide sequence of VGAM1030 RNA, herein designated VGAM RNA, also designated SEQ ID:3741.

[37952] A function of VGAM1030 is therefore inhibition of Low Density Lipoprotein Receptor (familial hypercholesterolemia) (LDLR, Accession NM_000527), a gene which also acts as a tumor suppressor. Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDLR. The function of LDLR has been established by previous studies. The low density lipoprotein receptor is a cell surface receptor that plays an important role in cholesterol homeostasis. The low density lipoprotein receptor is syn-

thesized as a 120-kD glycoprotein precursor that undergoes change to a 160-kD mature glycoprotein through the covalent addition of a 40-kD protein (Tolleshaug et al., 1982). Yamamoto et al. (1984) reported that the human LDL receptor is an 839-amino acid protein rich in cysteine, with multiple copies of the Alu family of repetitive DNAs. Russell et al. (1984) demonstrated DNA sequence homology of the LDL receptor with the epidermal growth factor receptor (EGF; 131530). Francke et al. (1984) assigned the LDL receptor to chromosome 19 on the basis of expression studies in hamster-human somatic cell hybrids. The LDLR gene was regionalized to 19p13.1-p13.3 by in situ hybridization (Lindgren et al., 1985). Frank et al. (1989) identified RFLPs of the mouse LDL receptor gene and used them to map the gene, designated *Ldlr*, to the proximal region of chromosome 9. Using interspecific backcrosses, they established the order and interval distances for this and several other loci on mouse chromosome 9, namely, APOA4 (OMIM Ref. No. 107690), which is on chromosome 11 in man, and mannosephosphate isomerase (OMIM Ref. No. 154550), which is on chromosome 15 in man. In a patient with homozygous familial hypercholesterolemia (FH; 143890), Hobbs

et al. (1986) described an LDL receptor mutant in which 1 of the 7 repeating units constituting the ligand binding domain had been deleted. The deletion arose by homologous recombination by repetitive Alu sequences in intron 4 and intron 5 of the gene. The deletion removed exon 5, which normally encodes the sixth repeat of the ligand binding domain. In the resultant mRNA, exon 4 was found to be spliced to exon 6, preserving the reading frame. The resulting shortened protein reaches the cell surface and reacts with antireceptor antibodies but does not bind LDL. It does, however, bind VLDL, a lipoprotein that contains apoprotein E as well as apoprotein B-100. The findings in this instructive case support the hypothesis that the 7 repeated sequences in the receptor constitute the LDL binding domain, that the sixth repeat is required for binding of LDL but not of VLDL, and that deletion of a single repeat can alter the binding specificity of the LDL receptor. Horsthemke et al. (1987) analyzed DNA from 70 patients in the UK with heterozygous familial hypercholesterolemia. In most, the restriction fragment pattern of the LDLR gene was indistinguishable from the normal; however, 3 patients were found to have a deletion of about 1 kb in the central portion of the gene. In 2 patients, the

deletion included all or part of exon 5 (606945.0027); in the third, the deletion included exon 7 (606945.0033). Including a previously described patient with a deletion in the 3-prime part of the gene, these results indicated that 4 out of 70 patients, or 6%, have deletions. Langlois et al. (1988) screened 234 unrelated heterozygotes for FH to detect major rearrangements in the LDLR gene. Total genomic DNA was analyzed by Southern blot hybridization to probes encompassing exons 1 to 18 of the LDLR gene. Six different mutations were detected and characterized by use of exon-specific probes and detailed restriction mapping. The frequency of deletions in the Langlois et al. (1988) study was 2.5% (6 out of 234 patients). An illustration of previously mapped deletions and the deletions identified in this study (a total of 16) suggested that particular areas in the LDLR gene are susceptible to deletion. In a Japanese subject with homozygous hypercholesterolemia, Lehrman et al. (1987) found a 7.8-kb deletion in LDLR (606945.0029). The deletion joined intron 15 to the middle of exon 18, which encodes the 3-prime untranslated region, thereby removing all 3-prime splice acceptor sites distal to intron 15. The mRNA should produce a truncated receptor that lacks the normal membrane-

COOH terminus. Rudiger et al. (1991) reviewed previously described deletions in the LDLR gene in cases of familial hypercholesterolemia and reported the finding of a deletion in 3 of 25 unrelated patients with FH. Defesche and Kastelein (1998) stated that more than 350 different mutations had been found in patients with familial hypercholesterolemia. They tabulated the preferential geographic distribution that has been demonstrated for some of the LDL receptor mutations. For example, in the West of Scotland about half of the index cases of FH were found to have the cys163-to-tyr mutation (606945.0058). Defesche and Kastelein (1998) commented on the geographic associations of LDL receptor mutations within the Netherlands.

[37953] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37954] Durst, R.; Colombo, R.; Shpitzen, S.; Ben Avi, L.; Friedlander, Y.; Wexler, R.; Raal, F. J.; Marais, D. A.; Defesche, J. C.; Mandelshtam, M. Y.; Kotze, M. J.; Leitersdorf, E.; Meiner, V. : Recent origin and spread of a common Lithuanian mutation, G197del LDLR, causing familial hypercholesterolemia: positive selection is not always necessary to ac-

count for disease incidence among Ashkenazi Jews. Am. J. Hum. Genet. 68: 1172–1188, 2001. ; and

[37955] Rudiger, N. S.; Heinsvig, E. M.; Hansen, F. A.; Faergeman, O.; Bolund, L.; Gregersen, N. : DNA deletions in the low density lipoprotein (LDL) receptor gene in Danish families with fami.

[37956] Further studies establishing the function and utilities of LDLR are found in John Hopkins OMIM database record ID 606945, and in cited publications numbered 732–733, 5368–5373, 3029, 5374, 3032–3034, 5376–3037, 5141–3040, 5142–5144, 3897–3898, 5145–5149, 3899–3900, 5150–5152, 104, 3901–3902, 5153–5158, 3903–3906, 5505–5507, 3907–3908, 5508–5514, 3924, 5515–5525, 3614, 5568, 6088, 6089–6090, 3927, 6091–6100, 4958, 6101–6102, 392 and 6103 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Microtubule-associated Protein 1B (MAP1B, Accession NM_005909) is another VGAM1030 host target gene. MAP1B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com–

plementarity of the nucleotide sequences of MAP1B BINDING SITE, designated SEQ ID:12532, to the nucleotide sequence of VGAM1030 RNA, herein designated VGAM RNA, also designated SEQ ID:3741.

[37957] Another function of VGAM1030 is therefore inhibition of Microtubule-associated Protein 1B (MAP1B, Accession NM_005909), a gene which may have a role in neuronal plasticity and brain development. Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1B. The function of MAP1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM316. Arginyl Aminopeptidase (aminopeptidase B)-like 1 (RNPEPL1, Accession NM_018226) is another VGAM1030 host target gene. RNPEPL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNPEPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPEPL1 BINDING SITE, designated SEQ ID:20158, to the nucleotide sequence of VGAM1030 RNA, herein designated VGAM

RNA, also designated SEQ ID:3741.

[37958] Another function of VGAM1030 is therefore inhibition of Arginyl Aminopeptidase (aminopeptidase B)-like 1 (RNPEPL1, Accession NM_018226). Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPEPL1. Von Hippel-Lindau Syndrome (VHL, Accession NM_000551) is another VGAM1030 host target gene. VHL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:6158, to the nucleotide sequence of VGAM1030 RNA, herein designated VGAM RNA, also designated SEQ ID:3741.

[37959] Another function of VGAM1030 is therefore inhibition of Von Hippel-Lindau Syndrome (VHL, Accession NM_000551), a gene which may control rna stability through the selective degradation of rna-bound proteins. Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VHL. The function of VHL and its as-

sociation with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM197.FLJ00007 (Accession XM_048928) is another VGAM1030 host target gene.

FLJ00007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00007 BINDING SITE, designated SEQ ID:35305, to the nucleotide sequence of VGAM1030 RNA, herein designated VGAM RNA, also designated SEQ ID:3741.

[37960] Another function of VGAM1030 is therefore inhibition of FLJ00007 (Accession XM_048928). Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00007. FLJ10298 (Accession NM_018050) is another VGAM1030 host target gene. FLJ10298 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ10298 BINDING SITE, designated SEQ ID:19807, to the nucleotide sequence of VGAM1030 RNA, herein designated VGAM RNA, also designated SEQ ID:3741.

[37961] Another function of VGAM1030 is therefore inhibition of FLJ10298 (Accession NM_018050). Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10298. PRO1048 (Accession NM_018497) is another VGAM1030 host target gene. PRO1048 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1048 BINDING SITE, designated SEQ ID:20556, to the nucleotide sequence of VGAM1030 RNA, herein designated VGAM RNA, also designated SEQ ID:3741.

[37962] Another function of VGAM1030 is therefore inhibition of PRO1048 (Accession NM_018497). Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1048. LOC144108 (Accession XM_084736) is another

VGAM1030 host target gene. LOC144108 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144108 BINDING SITE, designated SEQ ID:37682, to the nucleotide sequence of VGAM1030 RNA, herein designated VGAM RNA, also designated SEQ ID:3741.

[37963] Another function of VGAM1030 is therefore inhibition of LOC144108 (Accession XM_084736). Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144108. LOC152441 (Accession XM_098230) is another VGAM1030 host target gene. LOC152441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152441 BINDING SITE, designated SEQ ID:41504, to the nucleotide sequence of VGAM1030 RNA, herein designated VGAM RNA, also designated SEQ ID:3741.

[37964] Another function of VGAM1030 is therefore inhibition of LOC152441 (Accession XM_098230). Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152441. LOC153688 (Accession XM_098416) is another VGAM1030 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41652, to the nucleotide sequence of VGAM1030 RNA, herein designated VGAM RNA, also designated SEQ ID:3741.

[37965] Another function of VGAM1030 is therefore inhibition of LOC153688 (Accession XM_098416). Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1031 (VGAM1031) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[37966] VGAM1031 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1031 was detected is described hereinabove with reference to Figs. 1-8.

[37967] VGAM1031 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Mild Yellowing Virus. VGAM1031 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37968] VGAM1031 gene encodes a VGAM1031 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1031 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1031 precursor RNA is designated SEQ ID:1017, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1017 is located at position 2997 relative to the genome of Beet Mild Yellowing Virus.

[37969] VGAM1031 precursor RNA folds onto itself, forming VGAM1031 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37970] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1031 folded precursor RNA into VGAM1031 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1031 RNA is designated SEQ ID:3742, and is provided hereinbelow with reference to the sequence listing part.

[37971] VGAM1031 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1031 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1031 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[37972] VGAM1031 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1031 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1031 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1031 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1031 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[37973] The complementary binding of VGAM1031 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1031 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1031 host target RNA into VGAM1031 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37974] It is appreciated that VGAM1031 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1031 host target genes. The mRNA of each one of this plurality of VGAM1031 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1031 RNA, herein designated VGAM RNA, and which when bound by VGAM1031 RNA causes inhibition of translation of respective one or more VGAM1031 host target proteins.

[37975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1031 gene, herein designated VGAM GENE, on one or more VGAM1031 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[37976] It is yet further appreciated that a function of VGAM1031 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1031 include diagnosis, prevention and treatment of viral infection by Beet Mild Yellowing Virus. Specific functions, and accordingly utilities, of VGAM1031 correlate with, and may be deduced from, the identity of the host target genes which VGAM1031 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[37977] Nucleotide sequences of the VGAM1031 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1031 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1031 are further described hereinbelow with reference to Table 1.

[37978] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1031 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1031 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37979] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1031 gene, herein designated VGAM is inhibition of expression of VGAM1031 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1031 correlate with, and may be deduced from, the identity of the target genes which VGAM1031 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[37980] TAR (HIV) RNA Binding Protein 2 (TARBP2, Accession NM_134323) is a VGAM1031 host target gene. TARBP2 BINDING SITE1 and TARBP2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TARBP2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TARBP2 BINDING SITE1 and TARBP2 BINDING SITE2, designated SEQ ID:28625 and SEQ ID:28627 respectively, to the nucleotide sequence of VGAM1031 RNA, herein designated VGAM RNA, also designated SEQ ID:3742.

[37981] A function of VGAM1031 is therefore inhibition of TAR (HIV) RNA Binding Protein 2 (TARBP2, Accession NM_134323), a gene which is involved in the regulation of HIV replication. Accordingly, utilities of VGAM1031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TARBP2. The function of TARBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.EGF-like-domain, Multiple 4 (EGFL4, Accession XM_029883) is another VGAM1032 host target gene.

EGFL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:30966, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37982] Another function of VGAM1032 is therefore inhibition of EGF-like-domain, Multiple 4 (EGFL4, Accession XM_029883). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL4. Galactosamine (N-acetyl)-6-sulfate Sulfatase (Morquio syndrome, mucopolysaccharidosis type IVA) (GALNS, Accession NM_000512) is another VGAM1032 host target gene. GALNS BINDING SITE1 and GALNS BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GALNS, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNS BINDING SITE1

and GALNS BINDING SITE2, designated SEQ ID:6123 and SEQ ID:6122 respectively, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37983] Another function of VGAM1032 is therefore inhibition of Galactosamine (N-acetyl)-6-sulfate Sulfatase (Morquio syndrome, mucopolysaccharidosis type IVA) (GALNS, Accession NM_000512). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNS. Leukemia Inhibitory Factor (cholinergic differentiation factor) (LIF, Accession NM_002309) is another VGAM1032 host target gene. LIF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIF BINDING SITE, designated SEQ ID:8094, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37984] Another function of VGAM1032 is therefore inhibition of Leukemia Inhibitory Factor (cholinergic differentiation factor) (LIF, Accession NM_002309). Accordingly, utilities of

VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIF. Methyl-CpG Binding Domain Protein 3 (MBD3, Accession NM_003926) is another VGAM1032 host target gene. MBD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBD3 BINDING SITE, designated SEQ ID:10019, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37985] Another function of VGAM1032 is therefore inhibition of Methyl-CpG Binding Domain Protein 3 (MBD3, Accession NM_003926), a gene which are subunits of the NURD (nucleosome remodeling and histone deacetylase) complex. Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD3. The function of MBD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Prospero-related Homeobox 1 (PROX1, Acces-

sion NM_002763) is another VGAM1032 host target gene. PROX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PROX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROX1 BINDING SITE, designated SEQ ID:8650, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37986] Another function of VGAM1032 is therefore inhibition of Prospero-related Homeobox 1 (PROX1, Accession NM_002763), a gene which may regulate gene expression and development of postmitotic undifferentiated young neurons. Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROX1. The function of PROX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621) is another VGAM1032 host target gene. TRPC6 BINDING SITE is HOST TARGET

binding site found in the 5' untranslated region of mRNA encoded by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:10973, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37987] Another function of VGAM1032 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621), a gene which has calcium channel activity. Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC6. The function of TRPC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_003349) is another VGAM1032 host target gene. UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2V1, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3, designated SEQ ID:9371, SEQ ID:22523 and SEQ ID:22770 respectively, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37988] Another function of VGAM1032 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_003349), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1. The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155.YY1 Transcription Factor (YY1, Accession NM_003403) is another VGAM1032 host target gene. YY1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by YY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

YY1 BINDING SITE, designated SEQ ID:9437, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37989] Another function of VGAM1032 is therefore inhibition of YY1 Transcription Factor (YY1, Accession NM_003403), a gene which is involved in transcriptional regulation and may play an important role in development and differentiation. Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YY1. The function of YY1 has been established by previous studies. Functionally, YY1 is a versatile factor, being a negative regulator in some systems and a positive regulator in others. In some systems, the function of YY1 as an activator or a repressor is specified by the presence of other proteins. By site-directed mutagenesis and overexpression of YY1 in human fibroblasts, Yan et al. (2002) showed that YY1, as well as HRY (OMIM Ref. No. 139605), functions as a transcriptional activator of acid alpha-glucosidase (GAA; 232300). In previous studies, Yan et al. (2001) had found that YY1, binding to the same element of the GAA gene in hepatoma cells, acts as a GAA transcription silencer. Oei and Shi (2001) noted that physical interaction had been reported between

YY1 and poly(ADP-ribose) polymerase (PARP; 173870).

PARP is a nuclear enzyme that catalyzes the synthesis of ADP-ribose polymers from NAD⁺, a function related to DNA repair and transcription. Oei and Shi (2001) found that overexpression of YY1 in HeLa cells resulted in intracellular accumulation of poly(ADP-ribose) and acceleration of DNA repair following damage with genotoxic agents, suggesting a functional as well as physical interaction between the proteins.

[37990] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[37991] Oei, S. L.; Shi, Y. : Transcription factor Yin Yang 1 stimulates poly(ADP-ribosyl)ation and DNA repair. *Biochem. Biophys. Res. Commun.* 284: 450-454, 2001. ; and

[37992] Yan, B.; Raben, N.; Plotz, P. H. : Hes-1, a known transcriptional repressor, acts as a transcriptional activator for the human acid alpha-glucosidase gene in human fibroblast cells. *Bi.*

[37993] Further studies establishing the function and utilities of YY1 are found in John Hopkins OMIM database record ID 600013, and in cited publications numbered 8350-8354, 3574-357 and 8355-8356 listed in the bibliography sec-

tion hereinbelow, which are also hereby incorporated by reference. E46L (Accession NM_013236) is another VGAM1032 host target gene. E46L BINDING SITE1 and E46L BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by E46L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E46L BINDING SITE1 and E46L BINDING SITE2, designated SEQ ID:14896 and SEQ ID:14897 respectively, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37994] Another function of VGAM1032 is therefore inhibition of E46L (Accession NM_013236). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E46L. FLJ14249 (Accession NM_106552) is another VGAM1032 host target gene. FLJ14249 BINDING SITE1 and FLJ14249 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ14249, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of FLJ14249 BINDING SITE1 and FLJ14249 BINDING SITE2, designated SEQ ID:28169 and SEQ ID:23986 respectively, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37995] Another function of VGAM1032 is therefore inhibition of FLJ14249 (Accession NM_106552). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14249. KIAA0939 (Accession XM_030524) is another VGAM1032 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31061, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37996] Another function of VGAM1032 is therefore inhibition of KIAA0939 (Accession XM_030524). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. MGC13170 (Accession NM_032712) is another

VGAM1032 host target gene. MGC13170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC13170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13170 BINDING SITE, designated SEQ ID:26431, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37997] Another function of VGAM1032 is therefore inhibition of MGC13170 (Accession NM_032712). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13170. Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM_015879) is another VGAM1032 host target gene. SIAT8C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT8C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT8C BINDING SITE, designated SEQ ID:18026, to the nucleotide sequence of

VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37998] Another function of VGAM1032 is therefore inhibition of Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM_015879). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8C. Ubiquitin Specific Protease 24 (USP24, Accession XM_165973) is another VGAM1032 host target gene. USP24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP24 BINDING SITE, designated SEQ ID:43816, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[37999] Another function of VGAM1032 is therefore inhibition of Ubiquitin Specific Protease 24 (USP24, Accession XM_165973). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP24. LOC115330

(Accession NM_138445) is another VGAM1032 host target gene. LOC115330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115330 BINDING SITE, designated SEQ ID:28809, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[38000] Another function of VGAM1032 is therefore inhibition of LOC115330 (Accession NM_138445). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115330. LOC149650 (Accession XM_086623) is another VGAM1032 host target gene. LOC149650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149650 BINDING SITE, designated SEQ ID:38792, to the nucleotide sequence of VGAM1032 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3743.

[38001] Another function of VGAM1032 is therefore inhibition of LOC149650 (Accession XM_086623). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149650. LOC158046 (Accession NM_145283) is another VGAM1032 host target gene. LOC158046 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158046 BINDING SITE, designated SEQ ID:29799, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[38002] Another function of VGAM1032 is therefore inhibition of LOC158046 (Accession NM_145283). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158046. LOC220565 (Accession XM_165417) is another VGAM1032 host target gene. LOC220565 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220565, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220565 BINDING SITE, designated SEQ ID:43633, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[38003] Another function of VGAM1032 is therefore inhibition of LOC220565 (Accession XM_165417). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220565. LOC222031 (Accession XM_168371) is another VGAM1032 host target gene. LOC222031 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:45132, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[38004] Another function of VGAM1032 is therefore inhibition of LOC222031 (Accession XM_168371). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC222031. LOC222962 (Accession XM_167291) is another VGAM1032 host target gene. LOC222962 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222962 BINDING SITE, designated SEQ ID:44627, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[38005] Another function of VGAM1032 is therefore inhibition of LOC222962 (Accession XM_167291). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222962. LOC256867 (Accession XM_170694) is another VGAM1032 host target gene. LOC256867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256867 BINDING SITE, designated SEQ ID:45472, to

the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[38006] Another function of VGAM1032 is therefore inhibition of LOC256867 (Accession XM_170694). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256867. LOC91923 (Accession XM_041526) is another VGAM1032 host target gene. LOC91923 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91923 BINDING SITE, designated SEQ ID:33544, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[38007] Another function of VGAM1032 is therefore inhibition of LOC91923 (Accession XM_041526). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91923. LOC92299 (Accession XM_044075) is another VGAM1032 host target gene. LOC92299 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC92299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92299 BINDING SITE, designated SEQ ID:34129, to the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, also designated SEQ ID:3743.

[38008] Another function of VGAM1032 is therefore inhibition of LOC92299 (Accession XM_044075). Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92299. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1033 (VGAM1033) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38009] VGAM1033 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1033 was detected is described hereinabove with reference to Figs. 1-8.

[38010] VGAM1033 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1033 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38011] VGAM1033 gene encodes a VGAM1033 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1033 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1033 precursor RNA is designated SEQ ID:1019, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1019 is located at position 105205 relative to the genome of Cercopithecine Herpesvirus 7.

[38012] VGAM1033 precursor RNA folds onto itself, forming VGAM1033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38013] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1033 folded precursor RNA into VGAM1033 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1033 RNA is designated SEQ ID:3744, and is provided hereinbelow with reference to the sequence listing part.

[38014] VGAM1033 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1033 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1033 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38015] VGAM1033 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1033 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1033 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1033 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1033 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[38016] The complementary binding of VGAM1033 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1033 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1033

host target RNA into VGAM1033 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38017] It is appreciated that VGAM1033 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1033 host target genes. The mRNA of each one of this plurality of VGAM1033 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1033 RNA, herein designated VGAM RNA, and which when bound by VGAM1033 RNA causes inhibition of translation of respective one or more VGAM1033 host target proteins.

[38018] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1033 gene, herein designated VGAM GENE, on one or more VGAM1033 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38019] It is yet further appreciated that a function of VGAM1033 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1033 correlate with, and may be deduced from, the identity of the host target genes which VGAM1033 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38020] Nucleotide sequences of the VGAM1033 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1033 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1033 are further

described hereinbelow with reference to Table 1.

[38021] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1033 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1033 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38022] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1033 gene, herein designated VGAM is inhibition of expression of VGAM1033 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1033 correlate with, and may be deduced from, the identity of the target genes which VGAM1033 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38023] BRF1 Homolog, Subunit of RNA Polymerase III Transcription Initiation Factor IIIB (*S. cerevisiae*) (BRF1, Accession NM_001519) is a VGAM1033 host target gene. BRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of BRF1 BINDING SITE, designated SEQ ID:7256, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38024] A function of VGAM1033 is therefore inhibition of BRF1 Homolog, Subunit of RNA Polymerase III Transcription Initiation Factor IIIB (*S. cerevisiae*) (BRF1, Accession NM_001519), a gene which is a general activator of RNA polymerase III. Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRF1. The function of BRF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232.CD34 Antigen (CD34, Accession NM_001773) is another VGAM1033 host target gene. CD34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD34 BINDING SITE, designated SEQ ID:7533, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3744.

[38025] Another function of VGAM1033 is therefore inhibition of CD34 Antigen (CD34, Accession NM_001773), a gene which is a monomeric cell surface antigen that is selectively expressed on human hematopoietic progenitor cells. Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD34. The function of CD34 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.GRB2-associated Binding Protein 2 (GAB2, Accession NM_080491) is another VGAM1033 host target gene. GAB2 BINDING SITE1 and GAB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GAB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE1 and GAB2 BINDING SITE2, designated SEQ ID:27844 and SEQ ID:14648 respectively, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38026] Another function of VGAM1033 is therefore inhibition of

GRB2-associated Binding Protein 2 (GAB2, Accession NM_080491), a gene which act as adapters for transmitting various signals. Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2. The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53. Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM_139202) is another VGAM1033 host target gene. MLC1 BINDING SITE1 and MLC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MLC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLC1 BINDING SITE1 and MLC1 BINDING SITE2, designated SEQ ID:29215 and SEQ ID:10311 respectively, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38027] Another function of VGAM1033 is therefore inhibition of Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM_139202). Accordingly, utili-

ties of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLC1. DKFZP434B195 (Accession NM_031284) is another VGAM1033 host target gene. DKFZP434B195 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434B195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B195 BINDING SITE, designated SEQ ID:25309, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38028] Another function of VGAM1033 is therefore inhibition of DKFZP434B195 (Accession NM_031284). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B195. FLJ20195 (Accession NM_017706) is another VGAM1033 host target gene. FLJ20195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ20195 BINDING SITE, designated SEQ ID:19281, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38029] Another function of VGAM1033 is therefore inhibition of FLJ20195 (Accession NM_017706). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20195. Interleukin 18 Binding Protein (IL18BP, Accession NM_005699) is another VGAM1033 host target gene. IL18BP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL18BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL18BP BINDING SITE, designated SEQ ID:12252, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38030] Another function of VGAM1033 is therefore inhibition of Interleukin 18 Binding Protein (IL18BP, Accession NM_005699). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with IL18BP. KIAA1196 (Accession XM_028968) is another VGAM1033 host target gene. KIAA1196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1196 BINDING SITE, designated SEQ ID:30820, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38031] Another function of VGAM1033 is therefore inhibition of KIAA1196 (Accession XM_028968). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1196. RASD Family, Member 2 (RASD2, Accession NM_014310) is another VGAM1033 host target gene. RASD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASD2 BINDING SITE, designated SEQ

ID:15605, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38032] Another function of VGAM1033 is therefore inhibition of RASD Family, Member 2 (RASD2, Accession NM_014310). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASD2. SCAMP5 (Accession NM_138967) is another VGAM1033 host target gene. SCAMP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAMP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP5 BINDING SITE, designated SEQ ID:29072, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38033] Another function of VGAM1033 is therefore inhibition of SCAMP5 (Accession NM_138967). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP5. Sialyltransferase 8D (alpha-2,

8-polysialyltransferase) (SIAT8D, Accession NM_005668) is another VGAM1033 host target gene. SIAT8D BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT8D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT8D BINDING SITE, designated SEQ ID:12223, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38034] Another function of VGAM1033 is therefore inhibition of Sialyltransferase 8D (alpha-2, 8-polysialyltransferase) (SIAT8D, Accession NM_005668). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8D. TRIP-Br2 (Accession NM_014755) is another VGAM1033 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16492, to the nucleotide sequence of

VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38035] Another function of VGAM1033 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC123242 (Accession XM_063548) is another VGAM1033 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:37241, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38036] Another function of VGAM1033 is therefore inhibition of LOC123242 (Accession XM_063548). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC124245 (Accession NM_144604) is another VGAM1033 host target gene. LOC124245 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC124245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124245 BINDING SITE, designated SEQ ID:29419, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38037] Another function of VGAM1033 is therefore inhibition of LOC124245 (Accession NM_144604). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124245. LOC129303 (Accession XM_059343) is another VGAM1033 host target gene. LOC129303 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129303 BINDING SITE, designated SEQ ID:36970, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38038] Another function of VGAM1033 is therefore inhibition of LOC129303 (Accession XM_059343). Accordingly, utilities

of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129303. LOC130497 (Accession XM_059439) is another VGAM1033 host target gene. LOC130497 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130497 BINDING SITE, designated SEQ ID:36993, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38039] Another function of VGAM1033 is therefore inhibition of LOC130497 (Accession XM_059439). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130497. LOC150319 (Accession XM_086816) is another VGAM1033 host target gene. LOC150319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150319 BINDING SITE, designated SEQ ID:38891, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38040] Another function of VGAM1033 is therefore inhibition of LOC150319 (Accession XM_086816). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150319. LOC222962 (Accession XM_167291) is another VGAM1033 host target gene. LOC222962 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222962 BINDING SITE, designated SEQ ID:44628, to the nucleotide sequence of VGAM1033 RNA, herein designated VGAM RNA, also designated SEQ ID:3744.

[38041] Another function of VGAM1033 is therefore inhibition of LOC222962 (Accession XM_167291). Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222962. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1034 (VGAM1034) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38042] VGAM1034 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1034 was detected is described hereinabove with reference to Figs. 1–8.

[38043] VGAM1034 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1034 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38044] VGAM1034 gene encodes a VGAM1034 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1034 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1034 precursor RNA is designated SEQ ID:1020, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1020 is located at position 108515 relative to the

genome of Cercopithecine Herpesvirus 7.

[38045] VGAM1034 precursor RNA folds onto itself, forming VGAM1034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38046] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1034 folded precursor RNA into VGAM1034 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1034 RNA is designated SEQ ID:3745, and is provided hereinbelow with reference to the sequence listing part.

[38047] VGAM1034 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1034 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1034 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[38048] VGAM1034 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1034 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1034 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1034 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1034 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38049] The complementary binding of VGAM1034 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1034 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1034 host target RNA into VGAM1034 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38050] It is appreciated that VGAM1034 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1034 host target genes. The mRNA of each one of this plurality of VGAM1034 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1034 RNA, herein designated VGAM RNA, and which when bound by VGAM1034 RNA causes inhibition of translation of respective one or more VGAM1034 host target proteins.

[38051] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1034 gene, herein designated VGAM GENE, on one or more VGAM1034 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38052] It is yet further appreciated that a function of VGAM1034 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of

VGAM1034 correlate with, and may be deduced from, the identity of the host target genes which VGAM1034 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38053] Nucleotide sequences of the VGAM1034 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1034 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1034 are further described hereinbelow with reference to Table 1.

[38054] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1034 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1034 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38055] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1034 gene, herein designated VGAM is inhibition of expression of VGAM1034 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1034 correlate with, and may be deduced

from, the identity of the target genes which VGAM1034 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38056] Protocadherin Alpha 1 (PCDHA1, Accession NM_031411) is a VGAM1034 host target gene. PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2, designated SEQ ID:25383 and SEQ ID:20864 respectively, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38057] A function of VGAM1034 is therefore inhibition of Protocadherin Alpha 1 (PCDHA1, Accession NM_031411). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA1. Protocadherin Alpha 10 (PCDHA10, Accession NM_018901) is another VGAM1034 host target gene. PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2 are HOST TARGET binding sites found in

untranslated regions of mRNA encoded by PCDHA10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2, designated SEQ ID:20874 and SEQ ID:20884 respectively, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38058] Another function of VGAM1034 is therefore inhibition of Protocadherin Alpha 10 (PCDHA10, Accession NM_018901). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA10. Protocadherin Alpha 13 (PCDHA13, Accession NM_018904) is another VGAM1034 host target gene. PCDHA13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA13 BINDING SITE, designated SEQ ID:20905, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38059] Another function of VGAM1034 is therefore inhibition of Protocadherin Alpha 13 (PCDHA13, Accession NM_018904). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA13. Protocadherin Alpha 2 (PCDHA2, Accession NM_018905) is another VGAM1034 host target gene. PCDHA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA2 BINDING SITE, designated SEQ ID:20915, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38060] Another function of VGAM1034 is therefore inhibition of Protocadherin Alpha 2 (PCDHA2, Accession NM_018905). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA2. Protocadherin Alpha 3 (PCDHA3, Accession NM_018906) is another VGAM1034 host target gene. PCDHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by PCDHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA3 BINDING SITE, designated SEQ ID:20925, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38061] Another function of VGAM1034 is therefore inhibition of Protocadherin Alpha 3 (PCDHA3, Accession NM_018906). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA3. Protocadherin Alpha 4 (PCDHA4, Accession NM_018907) is another VGAM1034 host target gene. PCDHA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA4 BINDING SITE, designated SEQ ID:20935, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38062] Another function of VGAM1034 is therefore inhibition of

Protocadherin Alpha 4 (PCDHA4, Accession NM_018907). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA4. Protocadherin Alpha 5 (PCDHA5, Accession NM_018908) is another VGAM1034 host target gene. PCDHA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA5 BINDING SITE, designated SEQ ID:20945, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38063] Another function of VGAM1034 is therefore inhibition of Protocadherin Alpha 5 (PCDHA5, Accession NM_018908). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA5. Protocadherin Alpha 6 (PCDHA6, Accession NM_018909) is another VGAM1034 host target gene. PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA6, cor-

responding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2, designated SEQ ID:20955 and SEQ ID:25587 respectively, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38064] Another function of VGAM1034 is therefore inhibition of Protocadherin Alpha 6 (PCDHA6, Accession NM_018909). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA6. Protocadherin Alpha 8 (PCDHA8, Accession NM_018911) is another VGAM1034 host target gene. PCDHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA8 BINDING SITE, designated SEQ ID:20975, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38065] Another function of VGAM1034 is therefore inhibition of

Protocadherin Alpha 8 (PCDHA8, Accession NM_018911). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA8. Protocadherin Alpha 9 (PCDHA9, Accession NM_031857) is another VGAM1034 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:25600, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38066] Another function of VGAM1034 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_031857), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM71. Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898) is another VGAM1034 host target gene. PCDHAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC1 BINDING SITE, designated SEQ ID:20844, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38067] Another function of VGAM1034 is therefore inhibition of Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC1. Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899) is another VGAM1034 host target gene. PCDHAC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

PCDHAC2 BINDING SITE, designated SEQ ID:20854, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38068] Another function of VGAM1034 is therefore inhibition of Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899). Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC2. Solute Carrier Family 22 (organic anion/cation transporter), Member 12 (SLC22A12, Accession NM_144585) is another VGAM1034 host target gene. SLC22A12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC22A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A12 BINDING SITE, designated SEQ ID:29402, to the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, also designated SEQ ID:3745.

[38069] Another function of VGAM1034 is therefore inhibition of Solute Carrier Family 22 (organic anion/cation transporter), Member 12 (SLC22A12, Accession NM_144585), a gene which is a urate -anion exchanger regulating blood

urate levels. Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A12. The function of SLC22A12 has been established by previous studies.

Enomoto et al. (2002) isolated a SLC22A12 cDNA from a human kidney cDNA library. The cDNA, which they called URAT1 for 'urate transporter-1,' corresponds to a gene of 2,642 basepairs encoding a protein of 555 amino acids, which they called URAT1 for 'urate transporter-1,' that is 42% identical to OAT4 (OMIM Ref. No. 607097). The hydropathy plot predicts 12 membrane-spanning domains in URAT1, which are similar to those in members of the OAT family. URAT1 has 3 consensus sequences for N-glycosylation and 2 cyclic AMP-dependent protein kinase phosphorylation sites. High stringency Northern analysis revealed predominant expression of URAT1 mRNA in the human adult and fetal kidney, and immunohistochemical analysis revealed that URAT1 protein is prominent in epithelial cells of the proximal tubule of the renal cortex. Under high magnification, the protein was found to be located in the luminal membrane of the epithelium of proximal tubules but not in that of distal tubules Enomoto et al. (2002) demonstrated that *Xenopus* oocytes injected

with URAT1 cRNA exhibited time-dependent transport activity of [14C]urate but not of various typical substrates of OATs or organic cation transporters. URAT1 was found to be a cotransporter with anions, in particular chloride, bromide, or iodine, but not fluoride. Enomoto et al. (2002) found that urate transport via URAT1 is inhibited selectively by organic anions such as lactate, nicotinate, acetoacetate, hydroxybutyrate, and succinate. Para-aminohippurate (PAH), the representative substrate of OATs, did not exert an inhibitory effect on urate uptake via URAT1, consistent with the observation that PAH has no effect on the fractional excretion of urate in humans. Benzbromarone, probenecid, phenylbutazone, sulfinpyrazone, nonsteroidal antiinflammatory drugs, and diuretics inhibited urate uptake. Trans-stimulation experiments indicated that the major counteranions that exchange for urate via URAT1 are organic anions rather than inorganic chloride. Patients with renal hypouricemia (OMIM Ref. No. 220150) have mutations in URAT1.

[38070] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38071] Enomoto, A.; Kimura, H.; Chairoungdua, A.; Shigeta, Y.;

Jutabha, P.; Cha, S. H.; Hosoyamada, M.; Takeda, M.; Sekine, T.; Igarashi, T.; Matsuo, H.; Kikuchi, Y.; Oda, T.; Ichida, K.; Hosoya, T.; Shimokata, K.; Niwa, T.; Kanai, Y.; Endou, H. : Molecular identification of a renal urate–anion exchanger that regulates blood urate levels. *Nature* 417: 447–452, 2002. ; and

[38073] Further studies establishing the function and utilities of SLC22A12 are found in John Hopkins OMIM database record ID 607096, and in cited publications numbered 10108 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1035 (VGAM1035) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38074] VGAM1035 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1035 was detected is described hereinabove with reference to Figs. 1–8.

[38075] VGAM1035 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1035 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38076] VGAM1035 gene encodes a VGAM1035 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1035 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1035 precursor RNA is designated SEQ ID:1021, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1021 is located at position 105937 relative to the genome of Cercopithecine Herpesvirus 7.

[38077] VGAM1035 precursor RNA folds onto itself, forming VGAM1035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38078] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1035 folded precursor RNA into VGAM1035 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1035 RNA is designated SEQ ID:3746, and is provided hereinbelow with reference to the sequence listing part.

[38079] VGAM1035 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1035 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1035 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38080] VGAM1035 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1035 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1035 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1035 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1035 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[38081] The complementary binding of VGAM1035 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1035 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1035 host target RNA into VGAM1035 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38082] It is appreciated that VGAM1035 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1035 host target genes. The mRNA of each one of this plurality of VGAM1035 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1035 RNA, herein designated VGAM RNA, and which when bound by VGAM1035 RNA causes inhibition of translation of respective one or more VGAM1035 host target proteins.

[38083] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1035 gene, herein designated VGAM GENE, on one or more VGAM1035 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38084] It is yet further appreciated that a function of VGAM1035 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1035 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1035 correlate with, and may be deduced from, the identity of the host target genes which VGAM1035 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38085] Nucleotide sequences of the VGAM1035 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1035 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1035 are further described hereinbelow with reference to Table 1.

[38086] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1035 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1035 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38087] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1035 gene, herein designated VGAM is inhibition of expression of VGAM1035 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1035 correlate with, and may be deduced from, the identity of the target genes which VGAM1035 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38088] CRACC (Accession NM_021181) is a VGAM1035 host target gene. CRACC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRACC, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRACC BINDING SITE, designated SEQ ID:22152, to the nucleotide sequence of VGAM1035 RNA, herein designated VGAM RNA, also designated SEQ ID:3746.

[38089] A function of VGAM1035 is therefore inhibition of CRACC (Accession NM_021181), a gene which may participate in adhesion reactions between t lymphocytes and accessory cells. Accordingly, utilities of VGAM1035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRACC. The function of CRACC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM26.LOC112885 (Accession NM_138415) is another VGAM1035 host target gene. LOC112885 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112885, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112885 BINDING SITE, designated SEQ ID:28785, to

the nucleotide sequence of VGAM1035 RNA, herein designated VGAM RNA, also designated SEQ ID:3746.

[38090] Another function of VGAM1035 is therefore inhibition of LOC112885 (Accession NM_138415). Accordingly, utilities of VGAM1035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112885. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1036 (VGAM1036) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38091] VGAM1036 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1036 was detected is described hereinabove with reference to Figs. 1–8.

[38092] VGAM1036 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1036 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38093] VGAM1036 gene encodes a VGAM1036 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1036 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1036 precursor RNA is designated SEQ ID:1022, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1022 is located at position 108759 relative to the genome of Cercopithecine Herpesvirus 7.

[38094] VGAM1036 precursor RNA folds onto itself, forming VGAM1036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38095] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1036 folded precursor RNA into VGAM1036 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1036 RNA is designated SEQ ID:3747, and is provided hereinbelow with reference to the sequence listing part.

[38096] VGAM1036 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1036 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1036 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38097] VGAM1036 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1036 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1036 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1036 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1036 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38098] The complementary binding of VGAM1036 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1036 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1036 host target RNA into VGAM1036 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38099] It is appreciated that VGAM1036 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1036 host target genes. The mRNA of each one of this plurality of VGAM1036 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1036 RNA, herein designated VGAM RNA, and which when bound by VGAM1036 RNA causes inhibition of translation of respective one or more VGAM1036 host target proteins.

[38100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1036 gene, herein designated VGAM GENE, on one or more VGAM1036 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[38101] It is yet further appreciated that a function of VGAM1036 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1036 correlate with, and may be deduced from, the identity of the host target genes which VGAM1036 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38102] Nucleotide sequences of the VGAM1036 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1036 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1036 are further described hereinbelow with reference to Table 1.

[38103] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1036 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1036 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38104] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1036 gene, herein designated VGAM is inhibition of expression of VGAM1036 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1036 correlate with, and may be deduced from, the identity of the target genes which VGAM1036 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38105] Retinoic Acid Induced 14 (RAI14, Accession NM_015577) is a VGAM1036 host target gene. RAI14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI14 BINDING SITE, designated SEQ ID:17847, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38106] A function of VGAM1036 is therefore inhibition of Retinoic Acid Induced 14 (RAI14, Accession NM_015577), a gene

which is required for protein transport from the er to the golgi complex. Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI14. The function of RAI14 has been established by previous studies. Nagase et al. (2000) isolated a cDNA encoding RAI14, which they called KIAA1334, from a size-fractionated fetal brain cDNA library. Kutty et al. (2001) characterized the RAI14 gene, which they called NORPEG, from human retinal pigment epithelial cells (ARPE-19), in which its expression is induced by all-trans-retinoic acid. The predicted human and mouse proteins contain 980 and 979 amino acids, respectively, and share 84% sequence identity. Human RAI14 has a predicted molecular mass of 110 kD, a pI of 5.83, 6 potential N-glycosylation sites, several ankyrin repeats, and several coiled-coil helical domains. Northern blot analysis of human tissues detected expression of 2 transcripts of approximately 5 and 3 kb. Like the ARPE-19 cells, placenta showed an intense signal at 5 kb and a weak signal at 3 kb; the reverse was observed in testis, with an intense signal at 3 kb and a weak signal at 5 kb. RAI14 was also highly expressed in several human cancer cell lines. Expression studies showed that RAI14 localizes

to the cytoplasm. Confocal microscopic analysis in ARPE-19 cells showed threadlike projections in the cytoplasm reminiscent of the cytoskeleton. The expression of Rai14 was detected in mouse embryo at embryonic day 9.5 by in situ hybridization, and the expression appeared to be developmentally regulated. In adult mouse, the highest level of expression was detected in the seminiferous tubules of testis.

[38107] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38108] Kutty, R. K.; Kutty, G.; Samuel, W.; Duncan, T.; Bridges, C. C.; El-Sherbeeney, A.; Nagineni, C. N.; Smith, S. B.; Wiggert, B. : Molecular characterization and developmental expression of NORPEG, a novel gene induced by retinoic acid. J. Biol. Chem. 276: 2831-2840, 2001. ; and

[38109] Nagase, T.; Kikuno, R.; Ishikawa, K.; Hirose, M.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XVI. The complete sequences of 150 new cDNA clones from.

[38110] Further studies establishing the function and utilities of RAI14 are found in John Hopkins OMIM database record ID 606586, and in cited publications numbered 627 and

6371 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. UV Radiation Resistance Associated Gene (UVRAG, Accession NM_003369) is another VGAM1036 host target gene. UVRAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UVRAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UVRAG BINDING SITE, designated SEQ ID:9393, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38111] Another function of VGAM1036 is therefore inhibition of UV Radiation Resistance Associated Gene (UVRAG, Accession NM_003369). Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UVRAG. Zinc Finger Protein 36, C3H Type-like 1 (ZFP36L1, Accession NM_004926) is another VGAM1036 host target gene. ZFP36L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP36L1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP36L1 BINDING SITE, designated SEQ ID:11365, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38112] Another function of VGAM1036 is therefore inhibition of Zinc Finger Protein 36, C3H Type-like 1 (ZFP36L1, Accession NM_004926), a gene which is a regulatory protein involved in regulating the response to growth factors. Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP36L1. The function of ZFP36L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172) is another VGAM1036 host target gene. C1orf34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

C1orf34 BINDING SITE, designated SEQ ID:30439, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38113] Another function of VGAM1036 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM_027172). Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. HYPH (Accession XM_170722) is another VGAM1036 host target gene. HYPH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HYPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYPH BINDING SITE, designated SEQ ID:45484, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38114] Another function of VGAM1036 is therefore inhibition of HYPH (Accession XM_170722). Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYPH. KIAA1719 (Accession XM_042936) is another VGAM1036 host target gene. KIAA1719 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33828, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38115] Another function of VGAM1036 is therefore inhibition of KIAA1719 (Accession XM_042936). Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958) is another VGAM1036 host target gene. RNF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:10100, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38116] Another function of VGAM1036 is therefore inhibition of

Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958). Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF8. Zinc Metalloproteinase (STE24 homolog, yeast) (ZMPSTE24, Accession NM_005857) is another VGAM1036 host target gene. ZMPSTE24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZMPSTE24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZMPSTE24 BINDING SITE, designated SEQ ID:12462, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38117] Another function of VGAM1036 is therefore inhibition of Zinc Metalloproteinase (STE24 homolog, yeast) (ZMPSTE24, Accession NM_005857). Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZMPSTE24. LOC200301 (Accession XM_114197) is another VGAM1036 host target gene. LOC200301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC200301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200301 BINDING SITE, designated SEQ ID:42781, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38118] Another function of VGAM1036 is therefore inhibition of LOC200301 (Accession XM_114197). Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200301. LOC203286 (Accession XM_117526) is another VGAM1036 host target gene. LOC203286 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203286 BINDING SITE, designated SEQ ID:43494, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38119] Another function of VGAM1036 is therefore inhibition of LOC203286 (Accession XM_117526). Accordingly, utilities

of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203286. LOC257479 (Accession XM_171548) is another VGAM1036 host target gene. LOC257479 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257479 BINDING SITE, designated SEQ ID:46049, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38120] Another function of VGAM1036 is therefore inhibition of LOC257479 (Accession XM_171548). Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257479. LOC51696 (Accession NM_016217) is another VGAM1036 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC51696 BINDING SITE, designated SEQ ID:18312, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38121] Another function of VGAM1036 is therefore inhibition of LOC51696 (Accession NM_016217). Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. LOC91907 (Accession XM_041430) is another VGAM1036 host target gene. LOC91907 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91907, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91907 BINDING SITE, designated SEQ ID:33521, to the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, also designated SEQ ID:3747.

[38122] Another function of VGAM1036 is therefore inhibition of LOC91907 (Accession XM_041430). Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91907. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1037 (VGAM1037) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38123] VGAM1037 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1037 was detected is described hereinabove with reference to Figs. 1–8.

[38124] VGAM1037 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM1037 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38125] VGAM1037 gene encodes a VGAM1037 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1037 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1037 precursor RNA is designated SEQ ID:1023, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1023 is located at position 96311 relative to the

genome of Molluscum Contagiosum Virus.

- [38126] VGAM1037 precursor RNA folds onto itself, forming VGAM1037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [38127] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1037 folded precursor RNA into VGAM1037 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1037 RNA is designated SEQ ID:3748, and is provided hereinbelow with reference to the sequence listing part.
- [38128] VGAM1037 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1037 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1037 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[38129] VGAM1037 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1037 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1037 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1037 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1037 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[38130] The complementary binding of VGAM1037 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1037 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1037 host target RNA into VGAM1037 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38131] It is appreciated that VGAM1037 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1037 host target genes. The mRNA of each one of this plurality of VGAM1037 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1037 RNA, herein designated VGAM RNA, and which when bound by VGAM1037 RNA causes inhibition of translation of respective one or more VGAM1037 host target proteins.

[38132] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1037 gene, herein designated VGAM GENE, on one or more VGAM1037 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38133] It is yet further appreciated that a function of VGAM1037 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1037 include diagnosis, prevention and treatment of viral infection by Molluscum Contagiosum Virus. Specific functions, and accordingly utilities, of

VGAM1037 correlate with, and may be deduced from, the identity of the host target genes which VGAM1037 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38134] Nucleotide sequences of the VGAM1037 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1037 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1037 are further described hereinbelow with reference to Table 1.

[38135] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1037 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1037 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38136] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1037 gene, herein designated VGAM is inhibition of expression of VGAM1037 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1037 correlate with, and may be deduced

from, the identity of the target genes which VGAM1037 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38137] Collagen, Type XI, Alpha 2 (COL11A2, Accession NM_080680) is a VGAM1037 host target gene. COL11A2 BINDING SITE1 and COL11A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL11A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE1 and COL11A2 BINDING SITE2, designated SEQ ID:27973 and SEQ ID:27978 respectively, to the nucleotide sequence of VGAM1037 RNA, herein designated VGAM RNA, also designated SEQ ID:3748.

[38138] A function of VGAM1037 is therefore inhibition of Collagen, Type XI, Alpha 2 (COL11A2, Accession NM_080680). Accordingly, utilities of VGAM1037 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2. KIAA1388 (Accession XM_168030) is another VGAM1037 host target gene. KIAA1388 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

KIAA1388, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1388 BINDING SITE, designated SEQ ID:44948, to the nucleotide sequence of VGAM1037 RNA, herein designated VGAM RNA, also designated SEQ ID:3748.

[38139] Another function of VGAM1037 is therefore inhibition of KIAA1388 (Accession XM_168030). Accordingly, utilities of VGAM1037 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1388. LOC147299 (Accession XM_085763) is another VGAM1037 host target gene. LOC147299 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147299 BINDING SITE, designated SEQ ID:38330, to the nucleotide sequence of VGAM1037 RNA, herein designated VGAM RNA, also designated SEQ ID:3748.

[38140] Another function of VGAM1037 is therefore inhibition of LOC147299 (Accession XM_085763). Accordingly, utilities

of VGAM1037 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147299. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1038 (VGAM1038) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38141] VGAM1038 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1038 was detected is described hereinabove with reference to Figs. 1-8.

[38142] VGAM1038 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM1038 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38143] VGAM1038 gene encodes a VGAM1038 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1038 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1038 precursor RNA is designated SEQ ID:1024, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1024 is located at position 96469 relative to the genome of Molluscum Contagiosum Virus.

- [38144] VGAM1038 precursor RNA folds onto itself, forming VGAM1038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [38145] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1038 folded precursor RNA into VGAM1038 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1038 RNA is designated SEQ ID:3749, and

is provided hereinbelow with reference to the sequence listing part.

[38146] VGAM1038 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1038 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1038 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38147] VGAM1038 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1038 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1038 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1038 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1038 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38148] The complementary binding of VGAM1038 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1038 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1038 host target RNA into VGAM1038 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38149] It is appreciated that VGAM1038 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1038 host target genes. The mRNA of each one of this plurality of VGAM1038 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1038 RNA, herein designated VGAM RNA, and which when bound by VGAM1038 RNA causes inhibition of translation of respective one or more VGAM1038 host target proteins.

[38150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1038 gene, herein designated VGAM GENE, on one or more VGAM1038 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).
